PREFACE xxiii

1. TIME SERIES 1

Two workhorses 1
Markov chains 1
Stationary distributions 3
Asymptotic stationarity 4
Expectations 5
Forecasting functions 5
Simulating a Markov chain 6
The likelihood function 6
Stochastic linear difference equations 7
Moments 8
Impulse response function 10
Prediction and discounting 11
Stochastic discount factor 11
Population regression 12
The spectrum 14
Examples 15
Estimation 18
Concluding remarks 19
Appendix: A linear difference equation 20
Exercises 21

2. DYNAMIC PROGRAMMING 29

Sequential problems 29
Three computational methods 31
Cobb-Douglas transition, logarithmic preferences 33
Euler equations 35
A sample Euler equation 35
Stochastic control problems 35
Concluding remarks 37
Exercise 37

3. PRACTICAL DYNAMIC PROGRAMMING 39

The curse of dimensionality 39
Discretization of state space 39
Discrete-state dynamic programming 40
Application of Howard improvement algorithm 42
Numerical implementation 43
Modified policy iteration 44
Sample Bellman equations 45
Example 1: Calculating expected utility 45
Example 2: Risk-sensitive preferences 45
Example 3: Costs of business cycles 46
Polynomial approximations 47
Recommended computational strategy 48
Chebyshev polynomials 48
Algorithm: summary 49
Shape preserving splines 50
Concluding remarks 51

4. LINEAR QUADRATIC DYNAMIC PROGRAMMING 53

Introduction 53
The optimal linear regulator problem 53
Value function iteration 55
Discounted linear regulator problem 55
Policy improvement algorithm 55
The stochastic optimal linear regulator problem 56
Discussion of certainty equivalence 58
Shadow prices in the linear regulator 58
Stability 59
A Lagrangian formulation 61
The Kalman filter 65
Muth's example 67
Jovanovic's example 69
Concluding remarks 71
Appendix A: Matrix formulas 71
Appendix B: Linear-quadratic approximations 72
An example: the stochastic growth model 72
Kydland and Prescott's method 73
Determination of z 74
Log linear approximation 74
Trend removal 75
Exercises 75

5. SEARCH, MATCHING, AND UNEMPLOYMENT 81

Introduction 81
Preliminaries 81
Nonnegatlve random variables 81
Mean-preserving spreads 82
McCall's model of intertemporal job search 85
Effects of unemployment compensation, and mean preserving spreads . 90
Bathtub model 90
Waiting times 91
Quitting 92
Firing 93
A model of career choice 94
A simple version of Jovanovic's matching model 96
A longer horizon version of Jovanovic's model 106
The Bellman equations 107
Concluding remarks 109
Appendix: More practice with numerical dynamic programming . . . 109
Example 4: Search 110
Example 5: A Jovanovic model 110
Wage distributions 112
Separation probabilities 113
Numerical examples 113
Exercises 114

6. RECURSIVE (PARTIAL) EQUILIBRIUM 127

An equilibrium concept 127
Example: adjustment costs 127
A planning problem 130
Recursive competitive equilibrium 131
Markov perfect equilibrium 132
Computation 134
Linear Markov perfect equilibria 134
An example 137
Concluding remarks 138
Exercises 139

7. COMPETITIVE EQUILIBRIUM WITH COMPLETE MARKETS 143

Time-0 versus sequential trading 143
The physical setting 143
Preferences and endowments 143
Complete markets 144
Equilibrium pricing function 146
Examples 147
Risk sharing 147
No aggregate uncertainty 147
Periodic endowment processes 148
Interpretation of trading arrangement 148
Primer on asset pricing 149
Pricing redundant assets 149
Riskless consol 149
Riskless strips 149
Tail assets 150
Pricing one period returns 151
A recursive formulation: Arrow securities 152
Debt limits 152
Arrow securities 153
Equivalence of allocations 156
j-step pricing kernel 159
Arbitrage pricing 160
Consumption strips and the cost of business cycles 161
Consumption strips 161
Link to business cycle costs 162
Gaussian asset pricing model 163
Concluding remarks 166
Exercises 166

8. OVERLAPPING GENERATIONS MODELS 173

Endowments and preferences 174
Time-0 trading 174
Example equilibrium 175
Relation to the welfare theorems 175
Nonstationary equilibria 176
Computing equilibria 178
Sequential trading 182
Money 183
More computing equilibria 184
Equivalence of equilibria 185
Deficit finance 186
Steady states and the Laffer curve 187
Equivalent setups 189
The economy 189
Growth 191
Optimality and the existence of monetary equilibria 191
Balasko-Shell criterion for optimality 199
Within generation heterogeneity 200
Nonmonetary equilibrium 200
Monetary equilibrium 201
Nonstationary equilibria 202
The real bills doctrine 202
Gift giving equilibrium 204
Concluding remarks 206
Exercises 206

9. RICARDIAN EQUIVALENCE 219

Borrowing limits and Ricardian equivalence 219
Infinitely lived-agent economy 220
Solution to consumption/savings decision 221
Government 222
Effect on household 223
Linked generations interpretation 226
Concluding remarks 227

10. ASSET PRICING 229

Introduction 229
Asset Euler equations 229
Martingale theories of consumption and stock prices 231
Equivalent martingale measure 233
Equilibrium asset pricing 236
Stock prices without bubbles 237
Computing asset prices 238
Example 1: Logarithmic preferences 239
Example 2: A finite-state version 239
Example 3: Asset pricing with growth 240
The term structure of interest rates 240
State-contingent prices 243
Insurance premium 245
Man-made uncertainty 245
The Modigliani-Miller theorem 246
Government debt 249
The Ricardian proposition 249
No Ponzi schemes 254
Interpretation of risk-aversion parameter 258
The equity premium puzzle 260
Market price of risk 263
Hansen-Jagannathan bounds 265
Inner product representation of the pricing kernel 266
Classes of stochastic discount factors 267
A Hansen-Jagannathan bound 267
The Mehra-Prescott data 270
Factor models 271
Heterogeneity and incomplete markets 273
Concluding remarks 276
Exercises 277

11. ECONOMIC GROWTH 281

Introduction 281
The economy 283
Balanced growth path 284
Exogenous growth 285
Externality from spillovers 286
All factors reproducible 288
One-sector, model 288
Two-sector model 290
Research and monopolistic competition 292
Monopolistic competition outcome 293
Planner solution 296
Growth in spite of nonreproducible factors 297
"Core" of capital goods produced without nonreproducible inputs . . 297
Research labor enjoying an externality 299
Concluding comments 301
Exercises 303

12. OPTIMAL TAXATION WITH COMMITMENT 309

Introduction 309
A nonstochastic economy 310
Government 311
Households 312
Firms 313
The Ramsey problem 314
Definitions 314
Zero capital tax 315
Limits to redistribution 317
Primal approach to the Ramsey problem 319
Constructing the Ramsey plan 320
Revisiting a zero capital tax 322

Taxation of initial capital . . . 323
Nonzero capital tax due to incomplete taxation . . . 324
A stochastic economy . . . 325
Government . . . 326
Households . . . 326
Firms . . . 328
Indeterminacy of state-contingent debt and capital taxes . . . 329
The Ramsey plan under uncertainty . . . 331
Ex ante capital tax varies around zero . . . 332
Sketch of the proof of Proposition 2 . . . 334
Examples of labor tax smoothing . . . 335
Example 1: $g_t = g$ for all t . . . 339
Example 2: $g_t = 0$ for $t \leq T$, and $g_T > 0$ . . . 339
Example 3: $gt = 0$ for $t \wedge T$, and #y is stochastic . . . 340
Zero tax on human capital . . . 342
Should all taxes be zero? . . . 347
Concluding remarks . . . 348
Exercises . . . 350

13. SELF-INSURANCE . . . 353

Introduction . . . 353
The economy . . . 353
Nonstochastic endowment . . . 355
Stochastic endowment process . . . 356
Concluding remarks . . . 359

14. INCOMPLETE MARKETS MODELS 361

Introduction 361
A savings problem 362
Wealth-employment distributions 363
Reinterpretation of the distribution A 365
Example 1: A pure credit model 365
Equilibrium computation 366
Example 2: A model with capital 366
Computation of equilibrium 368
Unification and further analysis 368
Digression: the nonstochastic savings problem 369
Borrowing limits: "natural" and "ad hoc" 371
A candidate for a single state variable 371
Supermartingale convergence again 372
Average assets as function of r 374
Computed examples 376
Several models 379
Optimal stationary allocation 380
A model with capital and private IOUs 380
Private IOUs only 381
Limitation of what credit can achieve 381
Inside money interpretation 382
Bewley's basic model of fiat money 382
A model of seigniorage 383
Exchange rate indeterminacy 385
Interest on currency 386
Explicit interest 387
The upper bound on M 389
A very special case 389
Implicit interest through inflation 390
Precautionary savings 391
Models with fluctuating aggregate variables 393
Aiyagari's model again 393
Krusell and Smith's extension 394
Concluding remarks 397
Exercises 397

15. OPTIMAL SOCIAL INSURANCE 401

Insurance with recursive contracts 401
Social insurance without commitment 402
Many households 409
A Lagrangian method 409
A closed system 413
Many households 415
Endogenous borrowing constraints 416
Social insurance with asymmetric information 418
Efficiency implies b_s-i > b_s,w_s-i <w_s 420
Local upward and downward constraints are enough 420
Concavity of P 422
Local downward constraints always bind 423
Coinsurance 424
P'(v) is a martingale 424
Spreading continuation values 425
Martingale convergence and poverty 425
Extension to general equilibrium 427
Comparison with self-insurance 427
Optimal unemployment compensation 427
The autarky problem 428
Unemployment insurance with full information 429
Unemployment insurance with asymmetric information 430
Computed example 431
Interpretations 433
Extensions 434
Lending with moral hazard 435
Autarky 437
Investment with full insurance 437
Limited commitment and unobserved investment 439
Binding participation constraint 441
A property of the repayment schedule 441
Concluding remarks 443
Appendix A: Historical development 444
Spear and Srivastava 444
Timing 444
Use of lotteries 445

Appendix B: Computations for Atkeson's model 447

Exercises 449

16. CREDIBLE GOVERNMENT POLICIES 453

Introduction 453
The one-period economy 454
Competitive equilibrium 454
The Ramsey problem 455
Nash equilibrium 456
Examples of economies 457
Taxation example 457
Reduced-form example with discrete choice sets 459
E,eputational mechanisms: General idea 461
Dynamic programming 463
The infinitely repeated economy 464
Recursive formulation 465
Subgame perfect equilibrium (SPE) 468
Examples of SPE 470
Infinite repetition of one-period Nash equilibrium 470
Supporting better outcomes with trigger strategies 471
Values of all SPE 472
Self-enforcing SPE 476
Recursive strategies 477
Examples of SPE with recursive strategies 480
Infinite repetition of Nash outcome 481
Infinite repetition of a better than Nash outcome 481
Something worse: a stick and carrot strategy 482
The best and the worst SPE 483
Attaining the worst, method 1 484
Attaining the worst, method 2 485
Attaining the worst, method 3 485
Numerical example 485
Interpretations 487
Exercises 488

17. FISCAL-MONETARY THEORIES OF INFLATION 493

A shopping time monetary economy 494
Households 495
Government 497
Equilibrium 497
"Short run" versus "long run" 498
Stationary equilibrium 498
Initial date (time 0) 499
Equilibrium determination 499
Ten monetary doctrines 500
1. Sustained deficits cause inflation 501
2. Zero inflation policy 501
3. Unpleasant monetarist arithmetic 502
4. Quantity theory of money 502
5. An "open market" operation delivering neutrality 502
6. The "optimum quantity" of money 503
7. Legal restrictions to boost demand for currency 504
8. One big open market operation 504
9. A fiscal theory of the price level 506
10. Exchange rate (in)determinacy 507
10 (again). Determinacy of the exchange rate retrieved 509
Optimal inflation tax: The Friedman rule 509
Economic environment 510
Household's optimization problem 511
Ramsey plan 512
Time consistency of monetary policy 515
Model with monopolistically competitive wage setting 515
Perfect foresight equilibrium 517
Ramsey plan 520
Credibility of the Friedman rule 522
Concluding discussion 524
Exercises 525

18. CREDIT AND CURRENCY 533

Credit and currency with long-lived agents 533
Preferences and endowments 533
Complete markets 534
A Pareto problem 534
A complete markets equilibrium 535
Ricardian proposition 536
Loan market interpretation 537
A monetary economy 538
Townsend's "Turnpike" Interpretation 540
The Friedman rule 543
Welfare 545
Inflationary finance 546
Legal restrictions 551
A two-money model 553
A model of commodity money 557
Equilibrium 558
Virtue of fiat money 560
Concluding remarks 560
Exercises 561

19. EQUILIBRIUM SEARCH AND MATCHING 569

Introduction 569
An island model 570
A single market (island) 571
The aggregate economy 573
A matching model 575
A steady state 576
Analysis of welfare 578
Size of the match surplus 580
Matching model with heterogeneous jobs 581
A steady state 582
Welfare analysis 584
The allocating role of wages I: Separate markets 585
The allocating role of wages II: Wage announcements 587
Model of employment lotteries 589
Employment effects of layoff taxes 592
A model of employment lotteries with layoff taxes 592
An island model with layoff taxes 596
A matching model with layoff taxes 599
Kiyotaki-Wright search model of money 602
Monetary equilibria 604
Welfare 607
Concluding comments 609
Exercises 610

20. APPENDIX ON FUNCTIONAL ANALYSIS 625

Metric spaces and operators 625
Discounted dynamic programming 631
Policy improvement algorithm 633
A search problem 635

21. APPENDIX ON CONTROL AND FILTERING 637

Introduction 637
The optimal linear regulator control problem 637
Converting a problem with cross-products in states 639
An example 641
The Kalman filter 643
Duality 650
Examples of Kalman filtering 652
Linear projections 659
Hidden Markov chains 660
Optimal filtering 662
