Contents

Preface	vii
1 ■ Electron Bands	1
1.1 Where Do Bands Come From? 1	
1.1.1 Energy Splitting Due to Wavefunction Overlap 1	
1.1.2 The LCAO Approximation 7	
1.2 The Kronig-Penney Model 10	
1.3 Bloch's Theorem 15	
1.4 Crystals and Bravais Lattices 18	
1.5 X-ray Scattering 25	
1.6 General Properties of Bloch Functions 29	
1.7 Boundary Conditions in a Finite Crystal 33	
1.8 Density of States 36	
1.9 Electron Band Calculations in Three Dimensions 39	
1.9.1 How to Read a Band Diagram 40	
1.9.2 The Tight-Binding Approximation and Wannier Functions 41	
1.9.3 The Nearly-Free-Electron Approximation 45	
1.9.4 $k \cdot p$ Theory 48	
1.9.5 Other Methods of Calculating Band Structure 53	
1.10 Bands and Molecular Bonds 55	
1.10.1 Molecular Bonds 55	
1.10.2 Classes of Electronic Structure 57	
1.10.3 Molecular Bonds and Crystal Symmetry 60	
1.11 Surface States and Disorder 62	
2 ■ Electronic Quasiparticles	66
2.1 Quasiparticles 66	
2.2 Effective Mass 68	
2.3 Excitons 71	

2.4	Metals and the Fermi Gas	75
2.4.1	Isotropic Fermi Gas at $T = 0$	77
2.4.2	Fermi Gas at Finite Temperature	79
2.5	Basic Behavior of Semiconductors	81
2.5.1	Equilibrium Populations of Electrons and Holes	82
2.5.2	Semiconductor Doping	85
2.5.3	Equilibrium Populations in Doped Semiconductors	87
2.5.4	The Mott Transition	90
2.6	Band Bending and Heterojunctions	92
2.6.1	Metal-to-Metal Junctions	92
2.6.2	Doped Semiconductor Heterojunctions	94
2.6.3	Metal-Semiconductor Heterojunctions	96
2.6.4	Surface Band Bending	97
2.6.5	Junctions with Undoped Semiconductors	97
2.7	Quantum Confinement	99
2.7.1	Density of States in Quantum-Confined Systems	101
2.7.2	Superlattices	103
2.7.3	Disorder in Quantum-Confined Systems	107
2.7.4	The Two-Dimensional Electron Gas	108
2.8	Landau Levels and Quasiparticles in Magnetic Field	110
2.8.1	Density of States of Landau Levels	111
2.8.2	De Haas–Van Alphen and Shubnikov–De Haas Oscillations	114
2.8.3	The Integer Quantum Hall Effect	116
2.8.4	The Fractional Quantum Hall Effect and Higher-Order Quasiparticles	119

3 ■ Classical Waves in Anisotropic Media

124

3.1	Harmonic Approximation of the Interatomic Potential	124
3.2	Linear-Chain Model	126
3.3	Vibrational Modes in Higher Dimensions	130
3.4	Neutron Scattering	135
3.5	Phase Velocity and Group Velocity in Anisotropic Media	137
3.6	Acoustic Waves in Anisotropic Crystals	139
3.6.1	Stress and Strain Definitions; Elastic Constants	139
3.6.2	The Christoffel Wave Equation	145
3.6.3	Acoustic Wave Focusing	147
3.7	Electromagnetic Waves in Anisotropic Crystals	149
3.7.1	Maxwell's Equations in an Anisotropic Crystal	149
3.7.2	Uniaxial Crystals	153
3.7.3	The Index Ellipsoid	158

- 3.8 Electro-Optics 161
- 3.9 Piezoelectric Materials 164
- 3.10 Reflection and Transmission at Interfaces 167
 - 3.10.1 Optical Fresnel Equations 167
 - 3.10.2 Acoustic Fresnel Equations 170
 - 3.10.3 Surface Acoustic Waves 173
- 3.11 Photonic Crystals and Periodic Structures 175

4 ■ Quantized Waves

180

- 4.1 The Quantized Harmonic Oscillator 180
- 4.2 Phonons 184
- 4.3 Photons 189
- 4.4 Coherent States 193
- 4.5 Spatial Field Operators 198
- 4.6 Electron Fermi Field Operators 201
- 4.7 First-Order Time-Dependent Perturbation Theory 203
- 4.8 The Quantum Fokker-Planck Equation 208
 - 4.8.1 Equilibrium Distributions of Quantum Particles and the H-Theorem 212
- 4.9 Energy Density of Solids 215
 - 4.9.1 Density of States of Phonons and Photons 217
 - 4.9.2 Planck Energy Density 218
 - 4.9.3 Heat Capacity of Phonons 219
 - 4.9.4 Total Heat Capacity 222
- 4.10 Debye-Waller Effect 224

5 ■ Interactions of Quasiparticles

229

- 5.1 Electron-Phonon Interactions 229
 - 5.1.1 Deformation Potential Scattering 230
 - 5.1.2 Piezoelectric Scattering 235
 - 5.1.3 Fröhlich Scattering 236
 - 5.1.4 Average Electron-Phonon Scattering Time 237
- 5.2 Electron-Photon Interactions 239
 - 5.2.1 Optical Transitions between Semiconductor Bands 241
 - 5.2.2 Multipole Expansion 244
- 5.3 Interactions with Defects; Rayleigh Scattering 246
- 5.4 Phonon-Phonon Interactions 254
- 5.5 Electron-Electron Interactions 261
 - 5.5.1 Semiclassical Estimation of Screening Length 264
 - 5.5.2 Average Electron-Electron Scattering Time 266

- 5.6 The Relaxation-Time Approximation and the Diffusion Equation 268
- 5.7 Thermal Conductivity 273
- 5.8 Electrical Conductivity 275
- 5.9 The Boltzmann Transport Equation 279
- 5.10 Magnetoresistance 282
- 5.11 Drift of Defects and Dislocations—Plasticity 283

6 ■ Group Theory

289

- 6.1 Definition of a Group 289
- 6.2 Representations 293
- 6.3 Character Tables 295
- 6.4 Equating Physical States with the Basis States of Representations 299
- 6.5 Reducing Representations 303
- 6.6 Multiplication Rules for Outer Products 308
- 6.7 Getting the Terminology Straight 314
- 6.8 Allowed and Forbidden Transitions 315
 - 6.8.1 Group Theory in $k \cdot p$ Theory 317
 - 6.8.2 Second-Order Transitions 318
- 6.9 Effects of Lowering Symmetry 320
- 6.10 Spin and Time-Reversal Symmetry 327

7 ■ The Complex Susceptibility

331

- 7.1 A Microscopic View of the Dielectric Constant 331
- 7.2 Kramers-Kronig Relations 337
- 7.3 The Quantum Mechanical Oscillator 342
- 7.4 Polaritons 346
 - 7.4.1 Phonon-Polaritons 346
 - 7.4.2 Exciton-Polaritons 351
- 7.5 Nonlinear Optics and Photon-Photon Interactions 353
 - 7.5.1 Second-Harmonic Generation and Three-Wave Mixing 354
 - 7.5.2 Higher-Order Effects 357
- 7.6 Acousto-Optics and Photon-Phonon Interactions 360
- 7.7 Raman Scattering 364

8 ■ Many-Body Perturbation Theory

369

- 8.1 Higher-Order Time-Dependent Perturbation Theory 369
- 8.2 Polarons 376

- 8.3 Shift of Bands with Temperature 378
- 8.4 Line Broadening 380
- 8.5 Rayleigh-Schrödinger Diagram Rules 384
- 8.6 Feynman Perturbation Theory 389
- 8.7 Diagram Rules for Feynman Perturbation Theory 397
- 8.8 Self-Energy 401
- 8.9 Physical Meaning of the Green's Function 405
- 8.10 Screening and Plasmons 409
 - 8.10.1 Plasmons 413
 - 8.10.2 The Conductor-Insulator Transition and Screening 415
- 8.11 Exchange and Correlation Energy of Fermions 418
- 8.12 Vacuum Energy 423

9 ■ Coherence and Correlation

426

- 9.1 Three Types of Coherence 426
- 9.2 Density Matrix Formalism 427
- 9.3 The Bloch Equations 430
- 9.4 Magnetic Resonance 439
- 9.5 Quantum Coherent Effects 443
- 9.6 Correlation Functions and Noise 449
- 9.7 Correlations in Quantum Mechanics 455
- 9.8 Particle-Particle Correlation 459
- 9.9 The Fluctuation-Dissipation Theorem 464
- 9.10 Current Fluctuations and the Nyquist Formula 467
- 9.11 The Kubo Formula and Many-Body Theory of Metals 469
- 9.12 Mesoscopic Effects 475

10 ■ Spin and Magnetic Systems

485

- 10.1 Overview of Magnetic Properties 485
- 10.2 The Ising Model 489
 - 10.2.1 Zero External Magnetic Field; Spontaneous Symmetry Breaking 490
 - 10.2.2 External Magnetic Field; Hysteresis 494
- 10.3 Critical Fluctuations 497
 - 10.3.1 Critical Exponents and Magnetic Susceptibility 497
 - 10.3.2 Landau Coarse Graining Theory 499
- 10.4 Renormalization Group Methods 505
- 10.5 Spin Waves and Goldstone Bosons 509
- 10.6 Domains and Domain Walls 513

10.7	Spin-Spin Interaction	516
10.7.1	Ferromagnetic Instability	519
10.7.2	Localized States and RKKY Exchange Interaction	522
10.8	Spin Flip and Spin Dephasing	526
10.9	What Is Spin, Anyway?	532
11 ■	Spontaneous Coherence in Matter	537
11.1	Bose-Einstein Condensation	539
11.1.1	Theory of the Ideal Bose Gas	539
11.1.2	The Bogoliubov Model	542
11.1.3	The Stability of the Condensate; Analogy with Ferromagnets	546
11.1.4	Bose Liquid Hydrodynamics	550
11.1.5	Superfluids versus Condensates	554
11.2	Superconductors	558
11.2.1	Constructing Bosons from Fermions	558
11.2.2	Cooper Pairing	562
11.2.3	BCS Wavefunction	565
11.2.4	Excitation Spectrum of a Superconductor	570
11.2.5	Magnetic Effects of Superconductors	579
11.2.6	Josephson Junctions	589
11.3	Optical Coherence	591
11.3.1	Lasing as a Phase Transition	591
11.3.2	Excitonic Condensation	595
	Credits	600
	Index	604
