

Models of Cellular Regulation

Baltazar D. Aguda

Avner Friedman

Mathematical Biosciences Institute
The Ohio State University

OXFORD
UNIVERSITY PRESS

Contents

1	General introduction	1
1.1	Goals	1
1.2	Intracellular processes, cell states and cell fate: overview of the chapters	2
1.3	On mathematical modelling of biological phenomena	3
1.4	A brief note on the organization and use of the book	5
	References	5
2	From molecules to a living cell	6
2.1	Cell compartments and organelles	6
2.2	The molecular machinery of gene expression	9
2.3	Molecular pathways and networks	12
2.4	The <i>omics</i> revolution	15
	References & further readings	16
3	Mathematical and computational modelling tools	18
3.1	Chemical kinetics	18
3.2	Ordinary differential equations (ODEs)	22
■ 3.2.1	Theorems on uniqueness of solutions	22
3.2.2	Vector fields, phase space, and trajectories	23
3.2.3	Stability of steady states	24
3.3	Phase portraits on the plane	25
3.4	Bifurcations	27
3.5	Bistability and hysteresis	29
3.6	Hopf bifurcation	30
■ 3.7	Singular perturbations	32
3.8	Partial differential equations (PDEs)	33
3.8.1	Reaction-diffusion equations	33
■ 3.8.2	Cauchy problem	34
■ 3.8.3	Dirichlet, Neumann and third-boundary-value problems	35
■ 3.9	Well posed and ill posed problems	36
3.10	Conservation laws	37
3.10.1	Conservation of mass equation	37
3.10.2	Method of characteristics	38
3.11	Stochastic simulations	40
3.12	Computer software platforms for cell modelling	41

References	42
Exercises	42
4 Gene-regulatory networks: from DNA to metabolites and back	44
4.1 Genome structure of <i>Escherichia coli</i>	44
4.2 The Trp operon	45
4.3 A model of the Trp operon	47
4.4 Roles of the negative feedbacks in the Trp operon	50
4.5 The lac operon	52
4.6 Experimental evidence and modelling of bistable behavior of the lac operon	54
4.7 A reduced model derived from the detailed lac operon network	55
4.8 The challenge ahead: complexity of the global transcriptional network	61
References	62
Exercises	63
5 Control of DNA replication in a prokaryote	65
5.1 The cell cycle of <i>E. coli</i>	65
5.2 Overlapping cell cycles: coordinating growth and DNA replication	67
5.3 The oriC and the initiation of DNA replication	67
5.4 The initiation-titration-activation model of replication initiation	69
5.4.1 DnaA protein synthesis	70
5.4.2 DnaA binding to boxes and initiation of replication	71
5.4.3 Changing numbers of oriCs and dnaA boxes during chromosome replication	73
5.4.4 Death and birth of oriCs	74
5.4.5 Inactivation of dnaA-ATP	74
5.5 Model dynamics	74
5.6 Robustness of initiation control	75
References	77
Exercises	78
6 The eukaryotic cell-cycle engine	79
6.1 Physiology of the eukaryotic cell cycle	79
6.2 The biochemistry of the cell-cycle engine	80
6.3 Embryonic cell cycles	82
6.4 Control of MPF activity in embryonic cell cycles	85
6.5 Essential elements of the basic eukaryotic cell-cycle engine	87
6.6 Summary	93

References	95
Exercises	95
7 Cell-cycle control	96
7.1 Cell-cycle checkpoints	96
7.2 The restriction point	97
7.3 Modelling the restriction point	98
7.3.1 The G1–S regulatory network	98
7.3.2 A switching module	100
7.4 The G2 DNA damage checkpoint	101
7.5 The mitotic spindle checkpoint	104
References	106
Exercises	107
8 Cell death	108
8.1 Background on the biology of apoptosis	108
8.2 Intrinsic and extrinsic caspase pathways	109
8.3 A bistable model for caspase-3 activation	111
8.4 DISC formation and caspase-8 activation	115
8.5 Combined intrinsic and extrinsic apoptosis pathways	120
8.6 Summary and future modelling	122
References	124
Exercises	124
9 Cell differentiation	125
9.1 Cell differentiation in the hematopoietic system	126
9.2 Modelling the differentiation of Th lymphocytes	127
9.3 Cytokine memory in single cells	130
9.4 Population of differentiating Th lymphocytes	131
9.4.1 Equation for population density Φ	131
■ 9.4.2 Determining the population density Φ	133
9.5 High-dimensional switches in cellular differentiation	134
9.6 Summary	136
References	137
Exercises	137
10 Cell aging and renewal	139
10.1 Cellular senescence and telomeres	139
10.2 Models of tissue aging and maintenance	140
10.2.1 The probabilistic model of Op den Buijs <i>et al.</i>	140
10.2.2 A continuum model	142
10.3 Asymmetric stem-cell division	145
10.4 Maintaining the stem-cell reservoir	148
10.4.1 The Roeder–Loeffler model	148
10.4.2 A deterministic model	151
References	153
Exercises	153

11	Multiscale modelling of cancer	155
11.1	Attributes of cancer	155
11.2	A multiscale model of avascular tumor growth	156
11.2.1	Cellular scale	157
11.2.2	Extracellular scale	158
11.2.3	Subcellular scale	159
11.3	A multiscale model of colorectal cancer	160
11.3.1	Gene level: a Boolean network	161
11.3.2	Cell level: a discrete cell-cycle model	163
11.3.3	Tissue level: colonies of cells and oxygen supply	164
■ 11.4	Continuum models of solid tumor growth	167
11.4.1	Three types of cells	167
11.4.2	One type of cells	172
