
EMBRYOS, GENES, AND EVOLUTION

The Developmental - Genetic
Basis of Evolutionary Change

RUDOLF A. RAFF

◆◆◆◆◆ AND ◆◆◆◆◆

INDIANA UNIVERSITY PRESS
Bloomington and Indianapolis

Contents

Introduction to the Indiana Edition xi

Preface xxv

One

Embryos and Ancestors

- The Problem of Morphology 1
- Ontogeny, Phylogeny, and Recapitulation 8
- Developmental Mechanics and Mendelian Genetics 16
- Developmental Genetics 20

Two

Paleobiology and Evolutionary Theory: Time and Change

- Absolute and Relative Time 25
- Origins of Multicellular Life 28
- Gaps, Missing Links, and Evolutionary Mechanisms 34
- Rates of Evolution 45
- Rates of Size Change 50
- The Evolution of Shape 53

Three

Morphological and Molecular Evolution

- Varieties of Molecular Evolution 62
- Genes, Proteins, and "Molecular Clocks" 67
- Structural Genes and Regulators in Evolution 76
- Patterns of Speciation 82
- Time and Genetic Divergence 93

Four

Evolution and the Organization of Eggs and Embryos

- Spatial Organization and the Initiation of Morphogenesis 101
- Differential Gene Expression in Development 105
- Nature and Action of Localized Informational Molecules 112
- Establishment of Localization and Spatial Organization 116
- Evolutionary Changes in the Organization of Spiralian Eggs 124
- Changes in Egg Organization in the Origin of Advanced Protostome Groups 131

Evolutionary Changes in the Organization of Chordate Eggs	134
---	-----

Five

Interactions Within Embryos

Interaction and Integration	142
Induction and the Appearance of Structure	144
Dissociability of Inductive Interactions in Morphogenesis and Cytodifferentiation	150
Of Hen's Teeth and Lizard's Feathers	154
Interactions and Macroevolution	162

Six

Timing of Developmental Events: Evolution Through Heterochrony

Heterochrony: A Classical Mechanism for Evolutionary Change	173
Arboreal Salamanders and Frogs Without Tadpoles: Heterochrony and Morphological Adaptation	179
Mechanisms of Amphibian Heterochrony	189
Morphological and Molecular Recapitulation: A Cracked Mirror	192

Seven

Genetic Control of Development

Mutations and Changes in Ontogeny	199
Analysis of Time and Place of Gene Action	203
Maternal Effect Mutations	212
Mutations Affecting Organogenesis	218
Mutations Affecting Specific Organs	224
Cell Death in Normal Development	229
Genes Involved in Late Events and Growth	232

Eight

Homoeosis in Ontogeny and Phylogeny

Homoeosis and Homoeotic Mutations	235
Normal Segmentation in <i>Drosophila</i>	243
The Relation of Homoeosis to Normal Segmentation	246
Arthropod Phylogeny, or Homoeology Recapitulates Phylogeny	251

Nine

Pattern Formation

Pattern and the Origin of Form	262
The Determination of Limb Axes	263
Pattern Formation and the Specification of Position	264
Specification of Anterior-Posterior Polarity	267
Pattern Formation and Polar Coordinates	269
Binary Switches in the Interpretation of Position	272
The Origin of Segments	276
A Model of Gene Action in the Specification of Segmentation	280
Phenotypic Choice and the Morphogenetic Potential of the Genome	282

Ten

Adaptations for Gene Expression in Development

Embryonic Adaptations	287
How Many Genes Are Necessary for Development?	288
Genetic Cost of Development at the Molecular Level	294
Gene Switching and Multigene Families	300

Eleven

The Eucaryotic Genome and the C-Value Paradox

Genome Size and Organismal Complexity	313
A Three-Part Paradox	316
Genome Organization in Eucaryotes	320
Split Genes and Unexpected Consequences	325
Local Gene Switches	330

Twelve

Regulatory Hierarchies and Evolution: A Synthesis

Limitations of Evolutionary Syntheses	335
The Eye of the Needle	336
Integration	344
A Brief Anecdotal and Undocumented History	348
Novelties	350

Bibliography 357

Index 387
