# CONTENTS

|                                                                                                                                                    |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Preface                                                                                                                                            | v   |
| High-Performance Computing Requirements for Medium-Range<br>Weather Forecasting<br><i>A. J. Simmons</i>                                            | 1   |
| On "Retarded Potentials" in High-Performance Scientific Computing<br><i>F. Hossfeld</i>                                                            | 12  |
| Heterogeneous Distributed Computing for Weather Forecasts<br><i>G. De Pietro, R. Vaccaro</i>                                                       | 24  |
| A Parallel Spectral HIRLAM with the Data Parallel Programming Model<br>and with Message Passing – A Comparison<br><i>N. Gustafsson, D. Salmond</i> | 32  |
| A Data Parallel HIRLAM Forecast Model<br><i>L. Wolters, R. van Engelen, G. Cats, N. Gustafsson,<br/>T. Wilhelmsson</i>                             | 49  |
| The Operational HIRLAM 2 Model on Parallel Computers<br><i>T. Kauranne, J. Oinonen, S. Saarinen, O. Serimaa, J. Hietaniemi</i>                     | 63  |
| Implementation of the Semi-Implicit Scheme in a Message Passing<br>Version of HIRLAM<br><i>D. Bjørge</i>                                           | 75  |
| Parallel I/O on Meteorological GRIB Files<br><i>J. Hietaniemi, J. Oinonen, T. Kauranne, S. Saarinen, O. Serimaa</i>                                | 91  |
| Parallel Processor Systems for Numerical Weather Prediction and<br>Climate Research<br><i>R. Wiley</i>                                             | 108 |
| Experiences with Operational Use of Massively Parallel Systems<br><i>J. P. Peltier</i>                                                             | 114 |

|                                                                                                                                                                                                                                                                      |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Areas of Concern for Multiprocessing – Revisited after 10 Years<br><i>G.-R. Hoffmann</i>                                                                                                                                                                             | 123 |
| The CRAY T3D: Performance and Scalability<br><i>S. Oberlin</i>                                                                                                                                                                                                       | 128 |
| Evaluation of Parallel Processing Technology for Operational Capability at the Forecast Systems Laboratory<br><i>L. Hart, T. Henderson, B. Rodriguez</i>                                                                                                             | 142 |
| A Library for the Portable Parallelization of Operational Weather Forecast Models<br><i>B. Rodriguez, L. Hart, T. Henderson</i>                                                                                                                                      | 148 |
| Progress Toward Demonstrating Operational Capability of Massively Parallel Processors at the Forecast Systems Laboratory<br><i>T. Henderson, C. Baillie, S. Benjamin, M. Govett, L. Hart, A. Marroquin, B. Rodriguez, T. Black, R. Bleck, G. Carr, J. Middlecoff</i> | 162 |
| Implementation and Initial Results from a Parallel Version of the Meteorological Office Atmosphere Prediction Model<br><i>A. Dickinson, P. Burton, J. Parker, R. Baxter</i>                                                                                          | 177 |
| Controlling Load Balance, Cache Use and Vector Length in the Unified Model<br><i>R. Ford, D. Snelling, A. Dickinson</i>                                                                                                                                              | 195 |
| Adapting Parallel IFS/ARPEGE to METEO-FRANCE Implementation<br><i>J. F. Estrade, D. Birman</i>                                                                                                                                                                       | 206 |
| Experiences on Porting the “Deutschland-Modell” of DWD to Parallel Platforms and First Results<br><i>U. Schättler, E. Krenzien</i>                                                                                                                                   | 223 |
| Compiler Technology for Scalable Parallel Architectures – A Short Overview<br><i>H. P. Zima, B. M. Chapman, M. Pantano</i>                                                                                                                                           | 240 |
| Experiences with the PPPE Parallel Programming Toolset<br><i>F. G. Wollenweber</i>                                                                                                                                                                                   | 250 |

|                                                                                                                                                      |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Parallel Implementation, Validation, and Performance of MM5<br><i>J. Michalakes, T. Canfield, R. Nanjundiah, S. Hammond, G. Grell</i>                | 266 |
| Algorithm Comparison and Benchmarking Using a Parallel Spectral Transform Shallow Water Model<br><i>P. H. Worley, I. T. Foster, B. Toonen</i>        | 277 |
| Design Issues for the Parallelization of an Optimal Interpolation Algorithm<br><i>G. von Laszewski, M. Seablom, M. Makivic, P. Lyster, S. Ranka</i>  | 290 |
| The IFS Model – Overview and Parallel Strategies<br><i>S. R. M. Barros, D. Dent, L. Isaksen, G. Robinson</i>                                         | 303 |
| Performance of the IFS on Parallel Machines – Measurements and Predictions<br><i>U. Gärtel, W. Joppich, H. Mierendorff, A. Schüller</i>              | 319 |
| IFS 4D-Variational Analysis – Overview and Parallel Strategy<br><i>L. Isaksen, S. R. M. Barros</i>                                                   | 337 |
| The IFS Model – Performance Measurements<br><i>D. Dent, L. Isaksen, G. Mozdzyński, G. Robinson, F. Wollenweber, M. O’Keefe</i>                       | 352 |
| Distributed and Coupled Ocean-Atmosphere Modelling<br><i>E. Sevault, P. Noyret, L. Terray, O. Thual</i>                                              | 370 |
| Massively Parallel Atmospheric Modeling at NCAR<br><i>S. W. Hammond, R. D. Loft, J. M. Dennis, R. K. Sato</i>                                        | 395 |
| A Semi-Implicit Semi-Lagrangian Shallow-Water Model for Massively Parallel Processors<br><i>S. Thomas, J. Côté, A. Staniforth, I. Lie, R. Skålin</i> | 407 |
| Performance of a Number of Processors in Running GCMS at Different Resolutions<br><i>S. K. Dash, M. Periasamy</i>                                    | 424 |
| Forest Topology for Parallel Matrix Multiplication on a Multicomputer<br><i>M. K. Tandon</i>                                                         | 431 |

|                                                                                                                                                                  |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>The OCCAM Global Ocean Model</b><br><i>C. S. Gwilliam</i>                                                                                                     | 446 |
| <b>Parallelism in Semi-Lagrangian Transport</b><br><i>I. Lie, R. Skålin</i>                                                                                      | 455 |
| <b>Modelling Climate with a Spectral GCM on a Silicon Graphics<br/>Symmetric Multiprocessor</b><br><i>L. Rotstajn</i>                                            | 472 |
| <b>Parallelization of an OGCM on the CRAY T3D</b><br><i>J. M. Oberhuber, K. Ketelsen</i>                                                                         | 494 |
| <b>About the Parallelisation of the HOPE Ocean Model</b><br><i>V. Gülzow, K. Kleese</i>                                                                          | 505 |
| <b>A Parallel Coupled Oceanic-Atmospheric General Circulation Model</b><br><i>M. F. Wehner, A. J. Bourgeois, P. G. Eltgroth, P. B. Duffy,<br/>W. P. Dannevik</i> | 512 |
