Table of contents

Table of contents	1
Introduction	8
List of abbreviations	10
Constants	12
Chapter I: MASSIVE STARS	13
1. Definition	13
2. General observations	13
2.1. The HR diagram of massive stars with spectral type O3 - M5	15
2.1.1. The effective temperature and bolometric correction of massive stars	15
2.1.2. The absolute visual magnitude M_v of massive stars	18
2.1.3. The spectral type - luminosity class - M_{bol} - T_{eff} - (B-V) calibration of massive stars	19
2.2. The stellar wind of massive OB type stars	26
2.3. The chemical abundances in massive OBA type stars	31
2.4. Rotational properties of OB type stars	32
2.4.1. 'Normal' OB type stars	34
2.4.2. OBe type stars	35
2.5. LBVs	36
2.6. YSGs, RSGs and hypergiants	38
2.7. The WR stars	39
2.8. Circumstellar shells around massive stars	42
2.9. The SN explosion of a massive star	43
2.10. Summary	47
Chapter II: MASSIVE SINGLE STARS	49
3. The equations of stellar structure of a non-magnetic, non-rotating single star	49
3.1. The continuity of mass	50
3.2. The physical state of the plasma	50
3.2.1. Hydrostatic equilibrium	50

3.2.2.	Non-degeneracy and degeneracy: definition	51
3.2.3.	The equation of state of a non-degenerate plasma	51
3.2.4.	The equation of state of a degenerate plasma	52
3.2.5.	The Chandrasekhar mass limit of degenerate stars	53
3.2.6.	Neutron star masses	54
3.3.	The energy equation	55
3.3.1.	The energy generation rate by nuclear reactions ϵ	55
3.3.2.	The gravitational energy generation	59
3.4.	Energy transport	60
3.4.1.	Radiative energy transport	60
3.4.2.	Convective energy transport and mixing	61
3.4.3.	The boundary between convective and radiative layers ...	63
3.5.	The time-variation of mass in evolutionary computations	65
3.6.	Summary	66
3.7.	Surface layers - Boundary conditions	67
4.	Evolutionary computations of non-rotating massive single stars	70
4.1.	Small convective core overshooting	71
4.1.1.	The evolution of single stars with $5 M_{\odot} \leq M \leq 12 M_{\odot}$	71
4.1.2.	The evolution of single stars with $M > 12 M_{\odot}$	76
4.2.	The effect of large convective core overshooting	85
5.	Comparison between observations and evolutionary computations of non-rotating single stars	87
5.1.	Evolutionary computations with small convective core overshooting	87
5.1.1.	The core hydrogen burning phase	87
5.1.2.	The position of the RSGs and WR stars in the HR diagram	93
5.1.3.	The progenitor of SN 1987A	94
5.1.4.	The progenitor of SN 1993J	95
5.1.5.	The overall SN morphology of massive single stars	95
5.1.6.	The Blue Hertzsprung Gap (BHG)	96
5.1.7.	Chemical abundances in early B type supergiants	96
5.1.8.	The distribution of RSGs in the SMC	97
5.1.9.	Comparison between theoretical prediction of degenerate stars and observations	98
5.2.	Large convective core overshooting: is there a need?	100
6.	The effect of rotation on the evolution of massive single stars	101

6.1. Rotation-induced mixing in massive stars	101
6.2. Evolutionary computations of rotating stars	103
6.3. Comparison to observations	104
6.4. Summary	105
 Chapter III: MASSIVE CLOSE BINARIES	 106
7. General	106
8. The Roche model	106
8.1. Circularization and synchronization	107
8.2. Roche equipotentials	108
8.3. The Roche lobe overflow process	110
8.4. Limitations of the Roche model	111
8.5. The mass loss rate of the mass loser during the RLOF	111
8.6. The different types of unevolved massive close binaries	113
9. The mass transfer process during RLOF	116
9.1. Direct hit versus the formation of a Keplerian disc	116
9.2. The spin-up of the mass gainer due to mass transfer	117
9.3. Computation of the evolutionary behaviour of a mass gainer ...	118
9.3.1. The standard accretion model	120
9.3.2. The accretion induced full mixing model	123
10. The evolution of the binary period in MCBs	124
10.1. One or both components are losing mass by stellar wind only.	124
10.2. The variation of the period during RLOF	125
10.2.1. The RLOF mass loss dominates over a possible SW mass	
loss	126
10.2.1.1. Conservative RLOF	126
10.2.1.2. Non-conservative RLOF	127
10.2.1.3. Mergers	131
10.2.2. The RLOF and the SW mass loss rates are comparable	132
11. The effect of the supernova explosion of one of the components	132
12. Evolutionary computations of massive close binaries	137
12.1. The evolution of the primary before and during its RLOF	139
12.1.1. Massive primaries with initial mass $\leq 40\text{-}50 M_{\odot}$: case B _r	
with $q > 0.2$	139
12.1.2. Massive primaries with initial mass $\leq 40\text{-}50 M_{\odot}$: case B _r	
with $q \leq 0.2$, case B _c and case C	145

12.1.3. Massive primaries with initial mass $\leq 40\text{-}50 M_{\odot}$: case A....	147
12.1.4. Very massive primaries	150
12.1.5. The binary after RLOF: a CHeB+OB binary or a merger?	151
12.2. The evolution of the primary after RLOF: CHeB+[OB or low mass companion] binaries	153
12.2.1. The mass of the CHeB component $\geq 5 M_{\odot}$	154
12.2.2. The mass of the CHeB component $< 5 M_{\odot}$	156
12.2.3. The final fate of primaries of MCBs	158
12.3. The evolution of the secondary in a MCB	159
12.4. The formation and evolution of contact binaries	163
12.5. The evolution of a MCB after the collapse of the core of the primary	165
12.6. The effect of rotation on the evolution of a MCB	169
12.6.1. The primary	169
12.6.2. The secondary	170
13. Massive binaries: observations	170
13.1. Massive OBA+OBA binaries	171
13.1.1. Pre-RLOF OBA+OBA MBs	171
13.1.2. Massive OBA+OBA binaries during or after RLOF	179
13.2. WR+OB binaries	181
13.3. X-ray binaries	184
13.3.1. High mass X-ray binaries (HMXB).	184
13.3.1.1. HMXBs with an OBe type optical component	184
13.3.1.2. Standard HMXBs	185
13.3.1.3. HMXB candidates with a WR type component	187
13.3.2. Low mass X-ray binaries (LMXB) with a MCB history	187
13.3.3. The formation of X-rays with energies ≥ 1 keV	188
13.4. Radio pulsars	195
13.4.1. General	195
13.4.2. Binary radio pulsars	195
13.5. Massive star runaways	198
13.5.1. OB type runaways	198
13.5.2. Runaways other than OB type runaways	199
14. Comparison between the predicted evolution of MCBs and observations	200

14.1. The binaries HD 163181, HD 12323, HD 14633, HD 193516, HD25638, HD 209481, ϕ Per and υ Sgr	200
14.2. WR+OB binaries	207
14.2.1. WR+OB systems where RLOF/mass transfer did not occur	209
14.2.2. WR+OB systems where RLOF/mass transfer did occur: V 444 Cyg	211
14.2.3. WR stars with a less luminous OB type companion	218
14.2.4. WR stars with a normal low mass companion	219
14.2.5. Late O/early B type stars with a (too) faint WR type component	221
14.3. The formation of carbon enhanced OB type stars	221
14.4. The descendants of CHeB+OB binaries	222
14.4.1. HMXBs with an OB-type component: Vela X-1, Wray 977, Cyg X-1	223
14.4.2. The OB type runaways ζ Oph and ζ Pup	230
14.4.3. Critical remarks	235
14.5. The descendants of OB+cc binaries: the CHeB (WR)+cc candidates HD 50896, HD 197406 and Cyg X-3	236
14.5.1. The formation of X-rays in WR+cc binaries	237
14.5.2. The X-ray opacity in the wind in HMXBs	238
14.5.3. The expected X-rays in WR+cc binaries	245
14.5.4. The formation of WR stars with a cc in their center	251
14.6. The evolution of LMXBs: evidence for MCBs with very low mass ratio	251
14.7. SN-type of a MCB component: SN 1987A	255
14.8. Summary: the overall MCB evolutionary model	257
 Chapter IV: MASSIVE STAR POPULATION NUMBER SYNTHESIS	 262
15. General	262
16. Observations used as input in a population model	262
16.1. The initial mass function (IMF)	263
16.2. The IMF of starburst regions	264
16.3. The IMF of massive single stars and of primaries of MCBs	265
16.4. The overall MCB frequency in the solar neighbourhood	265

16.5. The observed mass ratio and period distribution of pre-RLOF MCBs in the solar neighbourhood	269
16.5.1. The observed mass ratio distribution	269
16.5.1.1. Method of determination	269
16.5.1.2. O-type primaries	271
16.5.1.3. B-type primaries	272
16.5.2. The observed period distribution	273
16.5.3. The implications of selection effects	274
16.6. The runaway velocities of single pulsars	275
17. The observations which need to be reproduced by a massive star population model	279
17.1. The B/R, WR/O and WC/WN number ratios	279
17.1.1. Continuous star formation regions	279
17.1.2. Starburst regions	280
17.2. WR+OB binaries	284
17.2.1. The WR+OB frequency	284
17.2.2. The q and P distribution of WR+OB	284
17.3. O-type runaways	286
17.4. The number of WR stars with a compact companion	286
17.5. The radio pulsar population	286
17.5.1. Solitary radio pulsars with a binary history	286
17.5.2. The formation rate of double neutron star systems in the Galaxy	287
17.6. The SN rate	288
18. The population number synthesis (PNS) model	289
18.1 The overall evolutionary model of single stars and MCBs	290
18.1.1. Single stars	290
18.1.2. MCBs	294
18.2. Method of computation	297
18.3. The parameters of the PNS model	298
19. PNS model calculations	301
19.1. The expected evolution of the observed galactic WR+OB sample	301
19.2. The predicted distribution of stars in regions of continuous star formation with a realistic binary formation frequency	303

19.2.1. The large number of stars observed in the Blue Hertzsprung Gap (BHG)	303
19.2.2. The distribution of O-type stars predicted by the PNS model	304
19.2.3. The WR population	307
19.2.4. The early B-type star population predicted by the PNS model	314
19.2.5. The theoretically expected number of binary pulsars	316
19.2.6. The theoretically expected number of single pulsars with a MCB history	319
19.2.7. The runaway velocity of single pulsars	319
19.3. The predicted distribution of stars in starburst regions with a realistic binary formation frequency	320
19.3.1. The population of B3-B0 type rapid rotators in starbursts...	322
19.3.2. The population of O and WR type stars in starbursts	322
19.3.3. The population of RSGs and WR type stars in starbursts...	326
19.3.4. Cooking recipe	327
19.4. The predicted SN type I _{b,c} /type II ratio in regions of continuous star formation with a realistic binary formation frequency	328
Concluding remarks	330
References	331
Index	343
