Agent-Based Computational Economics

How the idea originated and where it is going

Preface

PART I
Ideas and structures of the book

1 Economics in an interdisciplinary context
1.1 The interdisciplinary framework 5
1.2 Organization of the book 6

2 Agent-based modeling in the social sciences
2.1 What is it? 11
2.2 Why? 15
2.3 Agent-based modeling in different disciplines 18
2.4 The ten that make it new 24

PART II
Origins of ACE

3 The markets origin
3.1 Agent-based modeling of the tatonnement process 34
3.2 Agent-based modeling of the non-tatonnement process 38
3.3 Auctions 60
3.4 Macroeconomics 71
3.5 Interacting heterogeneous agents 83

4 Cellular automata
4.1 Segregation 89
4.2 Game of Life 92
4.3 Elementary cellular automata 94

4.4 Opinion dynamics and market sentiment 99
4.5 Other physics-oriented agent-based models 108
4.6 Further explorations 109

5 Economic tournament origin 113
5.1 Novelty-discovering agents 113
5.2 Tournament-based economic analysis 114
5.3 Automated open tournaments 116
5.4 Concluding remarks 119

6 Agent-based modeling of economic experiments 121
6.1 Agent-based modeling of cobweb experiments 122
6.2 Agent-based modeling of inflation experiments 128
6.3 Agent-based modeling of foreign exchange experiments 136
6.4 Concluding remarks 142

PART III
Designing artificial economic agents 145

7 Calibrated artificial agents 147
7.1 Challenges proposed 147
7.2 N-armed bandit problem 149
7.3 Reinforcement learning: Arthur's version 149
7.4 Early experiments on learning and choice-making 151
7.5 Concluding remark 155

8 Zero-intelligence agents in the DA markets 156
8.1 Principles beyond calibration 156
8.2 Double auction markets and experiments 157
8.3 Gode-Sunder model 157
8.4 Near zero-intelligence agents 159
8.5 Simplicity, intelligence, and randomness 160
8.6 Concluding remarks 163

9 Autonomous agents in the DA markets 165
9.1 Programmed agents and autonomous agents 165
9.2 Santa Fe double auction markets 167
9.3 Andrews-Prager model 176
9.4 AIE-DA tournaments 180
9.5 U-Mart 186
9.6 Wisdom of crowds 186
9.7 Further explorations 191

PART IV
Computational intelligence

10 Reinforcement learning
10.1 The three-parameter Roth-Ever model 196
10.2 Generalized reinforcement learning 198
10.3 Level-k reasoning and sophisticated EWA 202
10.4 Regime-switching agents 205

11 Fuzzy logic and rough sets
11.1 Fuzzy logic 207
11.2 Rough sets 209

12 Artificial neural networks
12.1 Multilayer perceptron neural networks 211
12.2 Radial basis network 213
12.3 Recurrent neural networks 214
12.4 Auto-associative neural networks 216
12.5 Support vector machines 219
12.6 Self-organizing maps and k-means 221
12.7 **K** *nearest neighbors 224*
12.8 Instance-based learning 225
12.9 Finite state automata 227
12.10 Decision trees 231
12.11 Further study 233

13 Evolutionary computation
13.1 Tools for evolutionary economics 237
13.2 Evolutionary strategies 239
13.3 Evolutionary programming 241
13.4 Genetic programming and genetic algorithms 242

PART V
Agent-based financial markets

14 Artificial financial markets with programmed agents
14.1 Few-type design 254
14.2 Many-type designs 258
14.3 Illustrations 260
14.4 A mesoscopic approach to complex dynamics 261
14.5 Market fraction hypothesis 266

15 Artificial financial markets with autonomous agents 275

15.1 Genetic algorithms 275
15.2 Classifier system 277
15.3 Genetic programming and autonomous agents 277
15.4 Artificial stock markets 278

16 Empirically based agent-based models 285

16.1 Financial stylized facts 285
16.2 Presenting agent-based economics with econometrics 292
16.3 Building ACE with econometrics 297
16.4 How to estimate? 297
16.5 What to estimate? 301
16.6 Forecasts with agent-based financial models 306
16.7 ACE as a foundation of econometrics 307
16.8 Concluding remarks 311

PART VI

Cognitive and psychological agent-based modeling 315

17 Economic significance of personal traits 317

17.1 Intelligence, income, and prosperity 317
17.2 Intelligence in experimental economics 317
17.3 Intelligence and risk preference 321
17.4 Intelligence and time preference 322
17.5 Personality and earning capacity 323
17.6 Personality in experimental economics 323
17.7 Culture in experimental economics 325

18 Neuroeconomic agents 333

18.1 Neuroeconomics: an ACE viewpoint 333
18.2 Preference 334
18.3 Value and choice 337
18.4 Risk 339
18.5 Learning 341
18.6 Software agents with neurocognitive dual system 342
18.7 Agent-based or brain-based? 343

19 Cognitive agents 345

19.1 Introduction: heterogeneity and hierarchy 345

19.2 Heterogeneity 347
19.3 Cognitive hierarchy 351
19.4 Concluding remarks 357
19.5 Further study 357

20 Culturally sensitive agents
20.1 Evolutionary models of cultures 360
20.2 Culturally based behavioral rules 360
20.3 Culturally based preference 361

21 Agent-based lottery market
21.1 Behavioral institutional economics 363
21.2 Lottery market designs 364
21.3 Lottery tax rates 369
21.4 Simulation 371
21.5 Agent-based modeling and policy design 372
21.6 Further exploration 373

PART VII
Networks

22 Graphs and social networks
22.1 Origin in sociology 378
22.2 Origin in mathematics: graphs 380
22.3 Network formation: sociophysical models 380
22.4 Networks in economics 386
22.5 Network formation: agent-based models 388
22.6 Further reading 394

PART VIII
Economics of changes

23 Agent-based modular economy
23.1 Twin assumptions of the modular economy 402
23.2 Preference and utility function 410
23.3 Firms'behavior 418
23.4 Markets 423
23.5 ModularEcon: a demonstration 427
23.6 Innovation 430
23.7 Further explorations 435

24 **Epilogue** 439
24.1 The Simon hierarchy 440
24.2 The Chomsky hierarchy 446
24.3 Challenges ahead 450

Bibliography 451
