ECONOMETRICS OF QUALITATIVE DEPENDENT VARIABLES

CHRISTIAN GOURIEROUX
CREST-INSEE, Paris

Translated by Paul B. Klassen

CAMBRIDGE
UNIVERSITY PRESS

Contents

1 Introduction **1**
1.1 Background . 1
1.2 Review of Qualitative Variables 1
1.3 Overview of the Book . ,' 4

2 **The Simple Dichotomy** **6**
2.1 Why not Use a Linear Model ? 6
2.2 Modeling the Simple Dichotomy "- 8
2.3 Examples 10
2.4 Estimation by the Maximum-Likelihood Method 11
2.5 Numerical Solution of the Likelihood Function 16.
2.6 Grouped Data 20
2.7 Example: Pass Rates of First-Year Medical Students in France 23
2.8 Specification Error 24

3 **Modelling** **38**
3.1 Grouping 38
3.2 Models with Interpretable Quantitative Variables 41
3.3 Individual Preferences: One Decision-Maker 44
3.4 Individual Preferences: Several Decision-Makers 52
3.5 Importance of the Sampling Method 58
3.6 Variations on the Basic Models 60

Appendix 3.1 Existence of a Utility Function **65**

Appendix 3.2 Compatibility Conditions **70**
A2.1 Necessary Condition 70
A2.2 Sufficient Condition 70

4 Estimation Methods and Tests **72**
4.1 The General Model 72
4.2 Estimation Methods 74
4.3 The Maximum-Likelihood Method 77
4.4 The Minimum Chi-Squared Method 83
4.5 The Generalized Berkson Method 85
4.6 Asymptotic Properties of the Estimators 88
4.7 Limited Information Maximum Likelihood (LIML) 91
4.8 Principal Test Procedures 94
4.9 Goodness of Fit 98
4.10 Omitted and Irrelevant Variables 100
4.11 A Test for the Polychotomous Logit Formulation 102

5 The Log-Linear Model and its Applications **107**
5.1 Introduction 107
5.2 The Case of Two Dichotomous Variables 109
5.3 The Case of Three Dichotomous Variables 115
5.4 Two Polychotomous Variables 126
5.5 General Analysis of a Contingency Table 128
5.6 The Log-Linear Model 135
5.7 Applications 140

6 Qualitative Panel Data **145**
6.1 Definition of a Markov Chain 145
6.2 Independent Observations on a Markov Chain (Micro Data) 147
6.3 Independent Observations on a Markov Chain (Macro Data) 152
6.4 Transition Probabilities Depending on the Explanatory Variables 159
6.5 Applications 164

7 The Tobit Model **170**
7.1 Censored Observations 170
7.2 The Simple Tobit Model 172
7.3 Least Squares Estimation 173
7.4 The Likelihood Function of the Simple Tobit Model 175
7.5 The Maximum-Likelihood Method 177
7.6 Two-Stage Estimation 181
7.7 The Method of Asymptotic Least Squares 184
7.8 The Generalized Tobit Model 186

7.9 Estimation with the Generalized Tobit Model 190
7.10 Robustness of the Estimation Methods 193
7.11 Generalized Residuals and Tests ,196

Appendix 7.1 Moments of the Truncated Norman Distribution 203

Appendix 7.2 Moments of the Truncated Norman Bivariate Distribution 206

8 Models of Market Disequilibrium 208
8.1 Observations orrthe Quantity Exchanged 208
8.2 Observation on the Regime and the Quantity Exchanged 215
8.3 Predetermined Evolution of the Price 216
8.4 Endogenous Evolution of Prices 218

9 Truncated Latent Variables Defined by a System of Simultaneous Equations 224
9.1 The General Model 224
9.2 Estimation Methods 226
9.3 Some Applications 230
9.4 The Maximum-Expectation (M.E.) Algorithm 239
9.5 Lagrange Multiplier Tests 242
9.6 Models with Serial Correlation 245

Appendix 9.1 A Model with Price Floors - The Recursive Case 249

10 Simultaneous Equation Systems with Truncated Latent Variables 252
10.1 The General Model 252
10.2 Some Examples 257
10.3 A Disequilibrium Model of Two Markets 260
10.4 Aggregation of Disequilibrium Markets 263

11 The Econometrics of Discrete Positive Variables: the Poisson Model 270
11.1 Introduction 270
11.2 The Simple Poisson Model 271
11.3 The Poisson Model with Stochastic Coefficients 272
11.4 The Bivariate Poisson Model 278

12 Duration Models **284**
12.1 The Basic Models 284
12.2 Discrete vs. Continuous Time 306
12.3 Explanatory Models 308
12.4 Estimation 313
12.5 Models with Heterogeneity 325
12.6 Renewal Processes 336
12.7 Optimal Search Strategy 341
12.8 Non-Parametric and Semi-Parametric Approaches 350

Appendix 12.1 Asymptotic Properties of ML under Neglected Heterogeneity **360**
A12.1 The Case of Sampling *(d* = 0) 360
A12.2 The Case with Explanatory Variables *(d* •=£ 0) .360
A12.3 Direction of the'Bias of the Constant Term 361
