Foreword by Mark Anson	xi
Introduction	xiii
Acknowledgments	xvii
PART I MEASURING RETURN AND RISK	1
1 Characteristics of Hedge Funds	3
1.1 What are hedge funds?	4
1.2 Investment styles	5
1.2.1 The tactical trading investment style	6
1.2.2 The equity long/short style	6
1.2.3 The event-driven style	7
1.2.4 The relative value arbitrage style	8
1.2.5 Funds of funds and multi-strategy funds	9
1.3 The current state of the hedge fund industry	10
2 Measuring Return	15
2.1 The difficulties of obtaining information	16
2.2 Equalization, crystallization and multiple share classes	18
2.2.1 The inequitable allocation of incentive fees	18
2.2.2 The free ride syndrome	19
2.2.3 Onshore versus offshore funds	20
2.2.4 The multiple share approach	21
2.2.5 The equalization factor/depreciation deposit approach	22
2.2.6 Simple equalization	26
2.2.7 Consequences for performance calculation	27
2.3 Measuring returns	27
2.3.1 The holding period return	27
2.3.2 Annualizing	29
2.3.3 Multiple hedge fund aggregation	30
2.3.4 Continuous compounding	32

3	Return and Risk Statistics	35
3.1	Calculating return statistics	35
3.1.1	Central tendency statistics	37
3.1.2	Gains versus losses	39
3.2	Measuring risk	39
3.2.1	What is risk?	40
3.2.2	Range, quartiles and percentiles	41
3.2.3	Variance and volatility (standard deviation)	42
3.2.4	Some technical remarks on measuring historical volatility/variance	43
3.2.5	Back to histograms, return distributions and z-scores	45
3.3	Downside risk measures	49
3.3.1	From volatility to downside risk	49
3.3.2	Semi-variance and semi-deviation	51
3.3.3	The shortfall risk measures	53
3.3.4	Value at risk	53
3.3.5	Drawdown statistics	55
3.4	Benchmark-related statistics	57
3.4.1	Intuitive benchmark-related statistics	57
3.4.2	Beta and market risk	58
3.4.3	Tracking error	59
4	Risk-Adjusted Performance Measures	61
4.1	The Sharpe ratio	65
4.1.1	Definition and interpretation	65
4.1.2	The Sharpe ratio as a long/short position	66
4.1.3	The statistics of Sharpe ratios	67
4.2	The Treynor ratio and Jensen alpha	70
4.2.1	The CAPM	70
4.2.2	The market model	72
4.2.3	The Jensen alpha	73
4.2.4	The Treynor ratio	75
4.2.5	Statistical significance	75
4.2.6	Comparing Sharpe, Treynor and Jensen	76
4.2.7	Generalizing the Jensen alpha and the Treynor ratio	77
4.3	M^2 , M^3 and Graham-Harvey	78
4.3.1	The M^2 performance measure	78
4.3.2	GH1 and GH2	80
4.4	Performance measures based on downside risk	82
4.4.1	The Sortino ratio	82
4.4.2	The upside potential ratio	83
4.4.3	The Sterling and Burke ratios	84
4.4.4	Return on VaR (RoVaR)	84
4.5	Conclusions	85
5	Databases, Indices and Benchmarks	87
5.1	Hedge fund databases	87
5.2	The various biases in hedge fund databases	87

5.2.1	Self-selection bias	-	88
5.2.2	Database/sample selection bias		90
5.2.3	Survivorship bias		90
5.2.4	Backfill or instant history bias		92
5.2.5	Infrequent pricing and illiquidity bias		93
5.3	From databases to indices		95
5.3.1	Index construction		95
5.3.2	The various indices available and their differences		98
5.3.3	Different indices-different returns		110
5.3.4	Towards pure hedge fund indices		113
5.4	From indices to benchmarks		116
5.4.1	Absolute benchmarks and peer groups		117
5.4.2	The need for true benchmarks		118
 PART II UNDERSTANDING THE NATURE OF HEDGE FUND RETURNS AND RISKS			 121
6	Covariance and Correlation		123
6.1	Scatter plots		123
6.2	Covariance and correlation		126
6.2.1	Definitions		126
6.2.2	Another interpretation of correlation		131
6.2.3	The Spearman rank correlation		132
6.3	The geometry of correlation and diversification		133
6.4	Why correlation may lead to wrong conclusions		135
6.4.1	Correlation does not mean causation		135
6.4.2	Correlation only measures linear relationships		136
6.4.3	Correlations may be spurious		137
6.4.4	Correlation is not resistant to outliers		138
6.4.5	Correlation is limited to two variables		139
6.5	The question of statistical significance		141
6.5.1	Sample versus population		141
6.5.2	Building the confidence interval for a correlation		142
6.5.3	Correlation differences		144
6.5.4	Correlation when heteroscedasticity is present		146
7	Regression Analysis		147
7.1	Simple linear regression		148
7.1.1	Reality versus estimation		148
7.1.2	The regression line in a perfect world		150
7.1.3	Estimating the regression line		151
7.1.4	Illustration of regression analysis: Andor Technology		154
7.1.5	Measuring the quality of a regression: multiple R , R^2 , ANOVA and p -values		154
7.1.6	Testing the regression coefficients		158
7.1.7	Reconsidering Andor Technology		159
7.1.8	Simple linear regression as a predictive model		161

Contents

7.2	Multiple linear regression	163
7.2.1	Multiple regression	163
7.2.2	Illustration: analyzing the Grossman Currency Fund	164
7.3	The dangers of model specification	167
7.3.1	The omitted variable bias	167
7.3.2	Extraneous variables	169
7.3.3	Multi-collinearity	170
7.3.4	Heteroscedasticity	170
7.3.5	Serial correlation	171
7.4	Alternative regression approaches	172
7.4.1	Non-linear regression	172
7.4.2	Transformations	172
7.4.3	Step wise regression and automatic selection procedures	173
7.4.4	Non-parametric regression	174
Asset Pricing Models		177
8.1	Why do we need a factor model?	178
8.1.1	The dimension reduction	179
8.2	Linear single-factor models	180
8.2.1	Single-factor asset pricing models	181
8.2.2	Example: the CAPM and the market model	182
8.2.3	Application: the market model and hedge funds	183
8.3	Linear multi-factor models	184
8.3.1	Multi-factor models	185
8.3.2	Principal component analysis	185
8.3.3	Common factor analysis	189
8.3.4	How useful are multi-factor models?	195
8.4	Accounting for non-linearity	197
8.4.1	Introducing higher moments: co-skewness and co-kurtosis	198
8.4.2	Conditional approaches	200
8.5	Hedge funds as option portfolios	202
8.5.1	The early theoretical models	202
8.5.2	Modeling hedge funds as option portfolios	203
8.6	Do hedge funds really produce alpha?	210
Styles, Clusters and Classification		213
9.1	Defining investment styles	213
9.2	Style analysis	214
9.2.1	Fundamental style analysis	215
9.2.2	Return-based style analysis	216
9.2.3	The original model	216
9.2.4	Application to hedge funds	219
9.2.5	Rolling window analysis	223
9.2.6	Statistical significance	225
9.2.7	The dangers of misusing style analysis	226
9.3	The Kalman filter	227
9.4	Cluster analysis	229

9.4.1	Understanding cluster analysis	229
9.4.2	Clustering methods	231
9.4.3	Applications of clustering techniques	239
PART III ALLOCATING CAPITAL TO HEDGE FUNDS		247
10	Revisiting the Benefits and Risks of Hedge Fund Investing	249
10.1	The benefits of hedge funds	250
10.1.1	Superior historical risk/reward trade-off	250
10.1.2	Low correlation to traditional assets	253
10.1.3	Negative versus positive market environments	255
10.2	The benefits of individual hedge fund strategies	259
10.3	Caveats of hedge fund investing	265
11	Strategic Asset Allocation - From Portfolio Optimizing to Risk Budgeting	267
11.1	Strategic asset allocation without hedge funds	267
11.1.1	Identifying the investor's financial profile: the concept of utility functions	268
11.1.2	Establishing the strategic asset allocation	270
11.2	Introducing hedge funds in the asset allocation	273
11.2.1	Hedge funds as a separate asset class	273
11.2.2	Hedge funds versus traditional asset classes	273
11.2.3	Hedge funds as traditional asset class substitutes	275
11.3	How much to allocate to hedge funds?	277
11.3.1	An informal approach	277
11.3.2	The optimizers' answer: 100% in hedge funds	278
11.3.3	How exact is mean-variance?	279
11.3.4	Static versus dynamic allocations	281
11.3.5	Dealing with valuation biases and autocorrelation	282
11.3.6	Optimizer's inputs and the GIGO syndrome	283
11.3.7	Non-standard efficient frontiers	287
11.3.8	How much to allocate to hedge funds?	287
11.4	Hedge funds as portable alpha overlays	288
11.5	Hedge funds as sources of alternative risk exposure	290
12	Risk Measurement and Management	295
12.1	Value at risk	296
12.1.1	Value at risk (VaR) is the answer	297
12.1.2	Traditional VaR approaches	297
12.1.3	The modified VaR approach	298
12.1.4	Extreme values	299
12.1.5	Approaches based on style analysis	303
12.1.6	Extension for liquidity: L-VaR	307
12.1.7	The limits of VaR and stress testing	310
12.2	Monte Carlo simulation	312
12.2.1	Monte Carlo for hedge funds	312
12.2.2	Looking in the tails	314

x	Contents		
	12.3	From measuring to managing risk	315
	12.3.1	The benefits of diversification	318
	13	Conclusions	321
