

CONTENTS OF VOLUME I

Introduction to the Series	v
Preface to the Handbook	vii

PART 1: ECONOMIC TOPICS

Chapter 1

Computable General Equilibrium Modelling for Policy Analysis and Forecasting PETER B. DIXON and B.R. PARMENTER	3
1. Introduction	4
1.1. Definition	5
1.2. Brief history	6
2. Solving a CGE model	9
2.1. The programming approach	10
2.2. The derivative approach: The Johansen/Euler method	12
2.3. Solving a multi-period model	24
3. An illustrative CGE model	36
3.1. Input-output database	37
3.2. Equations	39
3.3. Coefficients, parameters, zero problems and initial solution	48
3.4. Closure of the illustrative model	53
3.5. Simulations	55
4. Concluding remarks: Success, partial success and potential of CGE modelling	67
4.1. Success: Quantifying linkages between different parts of the economy	67
4.2. Partial success: Analysis of welfare effects	69
4.3. Potential: Disaggregated forecasting	76
References	79

Chapter 2

Computation of Equilibria in Finite Games RICHARD D. McKELVEY and ANDREW McLENNAN	87
1. Introduction	88
2. Notation and problem statement	90

3.	Computing a sample equilibrium	92
3.1.	Two-person games: The Lemke-Howson algorithm	92
3.2.	TV-person games: Simplicial subdivision	102
3.3.	Non-globally convergent methods	106
4.	Extensive form games	109
4.1.	Notation	109
4.2.	Extensive versus normal form	112
4.3.	Computing sequential equilibria	113
5.	Equilibrium refinements	115
5.1.	Two-person games	115
5.2.	n -person games	117
6.	Finding all equilibria	118
6.1.	Feasibility	119
6.2.	Exemplary algorithms for semi-algebraic sets	120
6.3.	Complexity of finding game theoretic equilibria	129
7.	Practical computational issues	133
7.1.	Software	133
7.2.	Computational complexity	137
	References	139

Chapter 3

Computational Methods for Macroeconometric Models

	Ray C. FAIR	143
1.	Introduction	144
2.	Notation	145
3.	Two stage least squares	146
4.	3SLS and FIML	146
5.	Two stage least absolute, deviations	150
6.	The Gauss-Seidel technique	152
7.	Stochastic simulation	155
7.1.	Numerical procedures for drawing values	156
8.	Optimal control	157
8.1.	Stochastic simulation option	158
9.	Asymptotic distribution accuracy	159
10.	Solution and FIML estimation of RE models	160
10.1.	Introduction	160
10.2.	The solution method	161
10.3.	Computational costs	164
10.4.	FIML estimation	165
10.5.	Stochastic simulation	166
10.6.	Conclusion	168
	References	169

Chapter 4

Mechanics of Forming and Estimating Dynamic Linear Economies

EVAN W. ANDERSON, LARS PETER HANSEN, ELLEN R. McGRATTAN and
THOMAS J. SARGENT

	171
1. Introduction	173
2. Control problems	173
2.1. Deterministic regulator problem	174
2.2. Augmented regulator problem	176
2.3. Discounted stochastic regulator problem	177
2.4. A class of linear-quadratic economies	180
3. Solving the deterministic linear regulator problem	182
3.1. Nonsingular A_{yy}	184
3.2. Singular A_{yy}	187
3.3. Continuous-time systems	189
4. Computational techniques for solving Riccati equations	192
4.1. Schur algorithm	192
4.2. Doubling algorithm	194
4.3. Matrix sign algorithm	200
5. Solving the augmented regulator problem	202
6. Computational techniques for solving Sylvester equations	205
6.1. The Hessenberg-Schur algorithm	205
6.2. Doubling algorithm	207
7. Distorted economies	208
8. Example economies	210
8.1. A model of permanent income with habit persistence	210
8.2. A model of education	212
8.3. A model of cattle cycles	215
9. Numerical comparisons	218
9.1. Solutions to Riccati equations	219
9.2. Solutions to Sylvester equations	223
10. Innovations representations	224
10.1. Wold and autoregressive representations	226
11. The likelihood function	227
12. Estimating the cattle cycles model	228
Appendix A. Computing $dL/d\delta$ and $dLJdd$ for a state-space model	232
A.1. The formula for $3L/dO$	232
A.2. Derivation of the formula	235
A.3. Standard errors	242
Appendix B. Differentiating the state-space model with respect to economic parameters	242
B.1. A linear-quadratic economy without distortions	242

B.2. A nonlinear economy without distortions	244
B.3. A linear-quadratic economy with distortions	246
References	250

Chapter 5

Nonlinear Pricing and Mechanism Design	
ROBERT WILSON	253
0. Introduction	255
1. Mirrlees' formulation	255
1.1. Statement of the nonlinear pricing problem	255
1.2. The incomplete problem	257
1.3. Auxiliary constraints	258
1.4. Statement of the incomplete problem	258
1.5. Necessary conditions for a solution	259
1.6. Examples	261
1.7. Lessons from a discrete-types formulation	265
2. Computational methods	266
2.1. Direct optimization	267
2.2. Approximation via Fourier series	268
2.3. Introduction to finite-difference methods	269
2.4. Relaxation combined with Newton's method	270
2.5. The pure relaxation algorithm	277
2.6. Other boundary shapes	278
2.7. Higher dimensions	279
2.8. Nonlinear equations	280
2.9. Construction of the price schedules and the tariff	281
2.10. An alternative version	283
3. The complete problem	284
4. A mechanism design formulation	285
5. Summary and conclusions	288
Appendix A. Pseudo-codes	290
Appendix B. APL programs	292
References	292

Chapter 6

Sectoral Economics	
DAVID A. KENDRICK	295
1. Introduction	296
2. Methods	297
2.1. Activity analysis	298
2.2. Location	304
2.3. Economies of scale	307

3. Software	—3:1-0
4. Process industries	314
4.1. Small static	314
4.2. Large static	316
4.3. Small dynamic	317
4.4. Examples of sectoral models	318
5. The computer industry	320
6. Energy	322
7. Environment	324
8. Agriculture	326
9. Linkages to computable general equilibrium and growth models	327
10. Limitations	327
11. Conclusions	328
References	328

PART 2: COMPUTER SCIENCE TOPICS

Chapter 7

Parallel Computation

ANNA NAGURNEY

335

1. Introduction	336
2. Technology for parallel computation	341
2.1. Parallel architectures	341
2.2. Parallel programming languages and compilers	348
2.3. Computer science issues in parallel algorithm development	350
3. Fundamental problem classes and numerical methods	354
3.1. Problem classes	355
3.2. Algorithms	361
4. Applications and numerical results	375
4.1. Nonlinear equations	375
4.2. Optimization problems	376
4.3. Parallel computation of variational inequality problems	384
4.4. Parallel computation of dynamical systems	393
Acknowledgements	400
References	401

Chapter 8

Artificial Intelligence in Economics and Finance: A State of the Art - 1994

The real estate price and assets and liability analysis case

L.F. PAU and TAN, PAN YONG

405

1. Introduction	407
-----------------	-----

1.1.	Historical perspective	407
1.2.	Plan of the chapter	408
2.	Motivations for the use of AI in economics and finance	409
3.	Real estate pricing and lending	411
3.1.	Problem analysis and adaptation of AI techniques to decision making goals	411
3.2.	Short definitions of main generic approaches	413
4.	Generic tasks	415
5.	Conventional AI approaches	416
5.1.	Knowledge-based systems	417
5.2.	Natural language processing	418
5.3.	Qualitative simulation	419
6.	Machine learning approaches	420
6.1.	Introduction to alternative machine learning approaches	420
6.2.	Tree induction: ID3	422
6.3.	Unsupervised learning: Conceptual clustering	424
6.4.	Neural processing	425
7.	Case-based reasoning in economics and finance	427
7.1.	Introduction	427
7.2.	Implementation of case-based reasoning in economics	428
7.3.	Potential applications of CBR in economics and finance	432
8.	Conclusions: Areas for further research	433
	Terminology	434
	References	437
<i>Chapter 9</i>		
	Neural Networks for Encoding and Adapting in Dynamic Economies	
	L-KOO CHO and THOMAS J. SARGENT	441
1.	Introduction	443
2.	Discriminant functions	444
3.	The perceptron	445
4.	Feedforward neural networks with hidden units	446
5.	Classifier systems	448
5.1.	The brain as an accounting system	448
5.2.	Generality versus discrimination	450
6.	Economic applications	450
6.1.	Arthur's artificial bandit	451
6.2.	Prisoner's dilemma	452
6.3.	Representation	454
6.4.	More general games	455
6.5.	Capital and moral hazard without discounting	457
6.6.	A model	458
6.7.	Linear strategies	460

7.	Conclusions and open questions	462
8.	Appendix	463
8.1.	Analysis of Theorem 2	463
	References	469

Chapter 10

Modeling Languages in Computational Economics: GAMS

	STAVROS A. ZENIOS	471
1.	Introduction	472
2.	Overview of the GAMS modeling language	473
2.1.	Domains of parameters and variables	474
2.2.	The GAMS arithmetic operations	475
2.3.	The GAMS summation and product operators	475
2.4.	Data entry and manipulations	475
2.5.	The GAMS relational operators •	477
2.6.	Declaration and definition of equations	477
2.7.	Exception handling capabilities	478
2.8.	GAMS solvers	478
2.9.	The GAMS libraries of economic and financial models	479
3.	Example applications	479
3.1.	A simple transportation model	480
3.2.	Asset allocation model	482
3.3.	The SAMBAL system: Estimating Social Accounting Matrices	484
	References	488

*Chapter 11**Mathematica* for Economists

	HAL R. VARIAN	489
1.	Introduction	490
2.	Design of <i>Mathematica</i>	490
3.	The front end	490
4.	Programming	491
4.1.	An example	491
4.2.	Defining functions	492
4.3.	Programming constructs	493
4.4.	Pattern matching	493
4.5.	Expressions	495
5.	Packages	496
6.	MathSource	496
7.	Applications in economics	496
7.1.	Comparative statics	496
7.2.	Dynamic programming	498

7.3.	Nash equilibria	•	499
7.4.	Econometrics and statistics		499
7.5.	Graphics	/	502
7.6.	Teaching		504
8.	Summary		505
	References		505

PART 3: NUMERICAL METHODS

Chapter 12

Approximation, Perturbation, and Projection Methods in Economic Analysis

KENNETH L. JUDD

509

1.	Introduction		51	1
2.	The uses of approximation ideas: An overview		513	
3.	The mathematical foundations of regular perturbation methods		515	
3.1.	The meaning of "approximation"		515	
3.2.	Taylor series approximation		516	
3.3.	Rational approximation		516	
3.4.	Implicit function theorem		517	
3.5.	Generalizations to function spaces		517	
4.	Applications of regular perturbation methods to economics		519	
4.1.	Comparative statics: A simple rule of thumb in tax theory		520	
4.2.	Comparative dynamics: A canonical problem		520	
4.3.	Perturbing dynamic equilibria		521	
4.4.	The stable manifold theorem and applications to economic theory		524	
4.5.	Perturbing functional equations from recursive equilibrium analyses		527	
5.	Bifurcation methods		540	
5.1.	Applications of the Hopf bifurcation to dynamic economic theory		541	
5.2.	Gauge functions		542	
5.3.	"Bifurcation applications to stochastic modelling		542	
6.	Asymptotic expansions of integrals		545	
6.1.	Econometric applications of asymptotic methods		547	
6.2.	Theoretical applications of Laplace's method		547	
7.	The mathematics of L^p approximations		548	
7.1.	Orthogonal polynomials		548	
7.2.	Least-squares orthogonal polynomial approximation		549	
7.3.	Interpolation		551	
7.4.	Approximation through interpolation		552	
7.5.	Approximation through regression		554	
7.6.	Piecewise polynomial interpolation		554	

7.7.	Shape-preserving interpolation	556
7.8.	Multidimensional approximation	557
8.	Applications of approximation to dynamic programming	560
8.1.	Discretization methods	562
8.2.	Multilinear approximation	563
8.3.	Polynomial approximations	563
9.	Projection methods	563
9.1.	General projection algorithm	565
10.	Applications of projection methods to rational expectations models	569
10.1.	Discrete-time deterministic optimal growth	569
10.2.	Stochastic optimal growth	572
10.3.	Problems with inequality constraints	574
10.4.	Dynamic games	574
10.5.	Continuous time problems	575
10.6.	Models with asymmetric information	575
10.7.	Convergence properties and accuracy of projection methods	577
11.	Hybrid perturbation-projection method	578
12.	Conclusions	580
	References	581

Chapter 13

Numerical Methods for Linear-Quadratic Models

HANS AMMAN

587

1.	Introduction	588
2.	Deterministic optimization	588
2.1.	Linear quadratic control: Discrete time	588
2.2.	Linear quadratic control: Continuous time	602
3.	Stochastic control	604
3.1.	Stochastic linear quadratic control: Discrete time	604
3.2.	Stochastic linear quadratic control: Continuous time	613
4.	Summary	614
	A note on software	615
	References	615

Chapter 14

Numerical Dynamic Programming in Economics

JOHN RUST

619

1.	Introduction	620
2.	MDPs and the theory of dynamic programming: A brief review	632
2.1.	Definitions of MDPs, DDP's and CDP's	632
2.2.	Bellman's equation, contraction mappings, and Blackwell's theorem	633

2.3.	Examples of analytic solutions to Bellman's equation for specific Test Problems"	636
3.	Computational complexity and optimal algorithms	639
3.1.	Discrete computational complexity	640
3.2.	Continuous computational complexity	641
4.	Numerical solution methods for general MDPs	648
4.1.	Discrete finite horizon MDPs	649
4.2.	Discrete infinite horizon MDPs	652
4.3.	Continuous finite horizon MDPs	669
4.4.	Continuous infinite horizon MDPs	697
5.	Conclusion	717
	References	722

Chapter 15

Monte Carlo Simulation and Numerical Integration

JOHN GEWEKE

731

1.	Introduction	733
2.	Deterministic methods of integration	734
2.1.	Unidimensional quadrature	734
2.2.	Multidimensional quadrature	735
2.3.	Low discrepancy methods	738
2.4.	Other deterministic methods	741
3.	Pseudorandom number generation	742
3.1.	Uniform pseudorandom number generation	743
3.2.	General methods for nonuniform distributions	745
3.3.	Selected univariate distributions	752
3.4.	Selected multivariate distributions	754
4.	Independence Monte Carlo	756
4.1.	Simple Monte Carlo	757
4.2.	Acceptance methods	759
4.3.	Importance sampling	761
4.4.	A note on the choice of method	764
5.	Variance reduction	769
5.1.	Antithetic Monte Carlo	770
5.2.	Systematic sampling	772
5.3.	The use of conditional expectations	773
5.4.	Control variables	774
6.	Markov chain Monte Carlo methods	775
6.1.	Two Markov chain Monte Carlo algorithms	777
6.2.	Mathematical background	779
6.3.	Convergence of the Gibbs sampler	781

6.4	Convergence of the Metropolis-Hastings algorithm		784
6.5.	Assessing convergence and numerical accuracy		785
7.	Some examples	<	788
7.1.	Stochastic volatility		788
7.2.	Integration and optimization		793
	References		797
	Index		801
