CONTENTS

PREFACE

xiii

CHAPTER 1 Aims, Background, Innovations and Presentation	1
1. Introduction	I
2. Background and innovations	2
2.1. Dynamics	4
(a) Physical capital accumulation	4
(b) Financial asset/liability accumulation	8
(c) Lagged adjustment processes	9
2.2. Closures of the MONASH model	10
(a) Historical and decomposition closures	11
(b) Forecast and policy closures	15
3. Presentation, computer code, reading strategy and themes	17
3 1. Organization of chapters •	19
3.2. Reading strategy	19
3 3 Twenty-one themes for investigation	20
(a) The MONASH equations	20
(b) Closures	20
(c) Result interpretation: back-of-the-envelope calculations and GDP decomposition	21
(d) Computational methods: the Johansen/Euler approach; initial solutions; homotopy variables; and the treatment of lags and leads	22
(e) Divisia indexes ,	24
(f) Measures of welfare	25
(g) Input-output data	25
(h) Other data	27
(i) Data allocation and adjustment: outside versus inside	27
(j) Phantom taxes	28
(k) Basic prices, purchasers' prices, margins and sales taxes	28
(l) Exports	29
(m) Imports	29
(n) The current account deficit, foreign liabilities, GNP, household disposable income and national wealth	30
(o) The public sector budget	31
(p) The labour market	31
(q) Investment and capital accumulation	32
(r) Technological changes and changes in consumer preferences	33

(s) CGE add-ons: regions; occupations; sub-input-output commodities; income distribution; and adjustment costs	34
(t) Analysis of adjustment costs	35
(u) Future directions	35

CHAPTER 2 An Illustrative Application of MONASH: the Australian Motor Vehicle Industry from 1987 to 2016	37
4. Introduction	37
5. Historical and decomposition simulations: the Australian motor vehicle industry from 1987 to 1994	38
5.1. Information for the period 1987 to 1994	38
5.2. The historical simulation	40
5.3. The decomposition simulation	42-
(a) Momentum and, accumulation in MONASH decomposition simulations	43
(b) Macroeconomic assumptions in the decomposition simulation	47
(c) Decomposition simulation: results	49
(d) Appendix: back-of-the-envelope explanation of results for net foreign liabilities	67
6. Forecast simulation: prospects for the Australian motor vehicle industry, 1998 to 2016	70
6.1. Forecast growth in imports relative to growth in domestic sales of domestically produced motor vehicles (M/D)	71
6.2. Forecast growth in sales of motor vehicles (S)	73
6.3. Forecast growth in output of motor vehicles (Z)	74
6.4. Summary of forecasts for motor vehicles	74
7. A policy simulation: the effects of reductions in the tariff on motor vehicles	74
7.1. Key assumptions	76
(a) Labour market	76
(b) Public expenditure and taxes	85
(c) Private consumption	86
(d) Rates of return on capital	87
(e) Production technologies	87
7.2. Results	88
(a) Macro effects: back-of-the-envelope model	88
(b) Decomposition of GDP deviations	93
(c) Consumption	100
(d) Welfare	102
(e) Results for the motor vehicle industry	103
(f) Results for other industries	106

8. Policy implications and concluding remarks	107
8.1. Policy implications	107
8.2. Back-of-the-envelope calculations	108
9. Appendix: the derivation of the formulas for analysing the difference between GDP paths in alternative simulations	109
CHAPTER 3 Mathematical Structure, Solution Algorithm and Computer Implementation: an Overview	113
10. Introduction	113
11. Overview of the mathematical structure of MONASH and ' introduction to the Johansen/Euler solution method	114
12. The input-output database and the initial solution	119
12.1. Structure of the input-output database	119
12.2. How do we obtain the input-output database for year t and how does it provide an initial solution?	124
13. Evaluation of the coefficients in 'linear systems such as (11.2) and (11.12)	128
14. Overview of the GEMPACK computations for the MONASH model	132
CHAPTER 4 The Theory of the MONASH Model	137
15. Introduction	137
16. A schematic version of the MONASH model	138
16.1. Equations of the schematic model	138
(a) Results of optimizing decisions	138
(b) Other demands (government and inventory)	151
(c) Exports	151
(d) Demands for margin services	152
(e) Supply equals demand for commodities	152
(f) Zero profits in production, importing, exporting and distribution	152
(g) Genuine and phantom indirect taxes	153
(h) Definitions of macro variables	154
(i) Capital, investment and rates of return	154
(j) Equations for facilitating historical and forecast simulations	156
(k) Equations for facilitating policy simulations	157
(l) The government accounts	157
(m) Equations for facilitating decomposition simulations	157
(n) Balance of payments	158
(o) Household disposable income and consumption function	158
16.2. A trial closure of the schematic version of MONASH	159
17. Results of optimizing decisions	161
17.1 Multi-level functions and decomposition of optimizing decisions	161

17.2. MONASH input technologies for current production and capital creation	166
17.3. The composition of industry outputs	169
17.4. Household demands	171
17.5. Technology and tastes	173
18. Demands for exports	179
19. Indirect taxes	181
19.1. Genuine and phantom sales taxes	181
19.2. Eliminating phantom tax flows from the input-output database	184
19.3. Special treatment of indirect taxes to facilitate the motor-vehicle tariff-cut simulation in section 7	186
20. Definitions of macro variables: interpretation of Divisia indexes	187
21. Capital-supply functions, rates of return and forward-looking expectations	189
21.1. Capital-supply functions	190
21.2. Actual and expected rates of return	193
21.3. Algorithm for handling forward-looking expectations	195
22. Computational strategy for decomposition simulations: halfway databases	198
23. Equations for facilitating historical and forecast simulations	200
23.1. Extrapolation of historical results: the case of import/domestic twists	202
24. Wage adjustment and welfare measures in policy simulations	204
24.1. Wage rates in policy simulations	205
24.2. Welfare measures	210
25. The public-sector account, the current account and the household account	212
26. Appendix: CRESH production functions and CRETH transformation frontiers	219
27. Appendix: the theory underlying the demand equations for traditional exports	222
28. Appendix: the levels representation of price and quantity indexes in MONASH	225
28.1. Recapitulation, the levels and deviations versions of MONASH, and solution by numerical integration	225
28.2. The mathematics of the levels representations of the MONASH price and quantity indexes	227
28.3. Interpretation of the MONASH price and quantity indexes	230
<i>i</i>	
CHAPTER 5 Developing the MONASH closures	233
29. Introduction	233
30. The decomposition closure (third column of Table 30.1)	234
31. Developing the historical closure (fourth column of Table 30.1)	240

32. Developing the forecast closure (second column of Table 30.1)	261
33. Developing the policy closure (first column of Table 30.1)	268
34. MONASH closures: concluding remarks	274
CHAPTER 6 Extensions, progress and the future	279
35. Introduction	279
36. Generating results for sub-national regions	279
37. Generating results for detailed occupations	282
38. Generating output results at a sub-input-output level	283
39. Generating distributional results: the real incomes of many types of households	286
40. Quantifying labour market adjustment costs	289
40.1. An index of labour market adjustment costs	290
40.2. Application of the Labour Input Loss Index	297
41. Progress and the future	299
41.1. Progress in MONASH on the ORANI agenda	300
41.2. Other progress	304
41.3. Client-driven research and future developments	305
