PART ONE
PRELIMINARIES

I HISTORICAL INTRODUCTION 3

1 History of Non-Euclidean Geometry 4

Euclid's Fifth Postulate • Alternative postulates of Proclos, Wallis, Legendre, Saccheri fj Gauss, and non-Euclidean geometry Q The geometry of Gauss, Bolyai, and Lobachevski Q Klein's model Q Inner properties of curved surfaces Q Curvature determined from distances Q The metric Q Gaussian curvature fj Riemannian geometry

2 History of the Theory of Gravitation 11

Galileo and falling bodies Q Measurements of the ratio of gravitational and inertial mass, by Newton, Bessel, Eotvos, and Dicke Q] The inverse-square law Q Newton's theory of gravitation Q Anomalous precession of the perihelia of Mercury • Newcomb and Seeliger

3 History of the Principle of Relativity 15

Inertial frames in Newtonian mechanics Q The Galileo group Q Noninertial frames and absolute space Q Newton's rotating bucket Q] Mach's principle fj Inertial frames and the rotation of the universe Q Maxwell's equations not Galilean-invariant • The ether Q The Michelson-Morley experiment • Lorentz invariance Q Relativity restored by Einstein Q The Principle of Equivalence fj Scalar gravitational theories Q Gravitation and the metric tensor Q The General Theory of Relativity

Bibliography 20

References 21

2 SPECIAL RELATIVITY 25

1 Lorentz Transformations 25

The transformations defined fj Invariant proper time fj Invariant speed of light Q] Only Lorentz transformations leave the proper time invariant fj Homogeneous, inhomogeneous, proper, improper Lorentz transformations Q Rotations and boosts

2 Time Dilatiqn 29

The special-relativistic dilation Q The Doppler effect

3 Particle Dynamics 31

Relativistic force fj The relativistic second law of motion

4 Energy and Momentum 32

The energy-momentum four-vector Q] The nonrelativistic limit fj Lorentz invariance of the conservation laws Q Mass as a form of energy

5 Vectors and Tensors 35

Contravariant and covariant four-vectors • Raising-and lowering indices Q Gradients fj Tensors fj Linear combinations, direct products, contraction, differentiation Q The Minkowski tensor Q The Levi-Civita tensor Q The zero tensor Q Lorentz invariant equations

6 Currents and Densities 39

The current four-vector fj Conservation • Constancy and Lorentz invariance of the total charge

7 Electrodynamics 41
The field-strength tensor \~\ Manifestly invariant forms of the Maxwell equations

8 Energy-Momentum Tensor 43
Energy-momentum tensor of point particles Q The conservation law Q Collisions Q Charged particles Q Energy-momentum tensor of electromagnetic fields

9 Spin 46
Total angular momentum Q Internal and orbital angular momenta Q The spin four-vector

10 Relativistic Hydrodynamics 47
Perfect fluids Q Pressure and proper energy density Q Energy-momentum tensor Q Velocity four-vector Q The particle current Q Relativistic Euler equation Q The entropy equation Q Equations of state Q Speed of sound

11 Relativistic Imperfect Fluids* 53
The Eckart formalism Q Entropy production Q Heat conduction, shear viscosity, bulk viscosity Q Lorentz covariant dissipative terms in the energy-momentum tensor Q Cases of small bulk viscosity

12 Representations of the Lorentz Group* 58
Group representations Q The infinitesimal Lorentz group Q Commutation relations Q The representations *{A, B) £2* Tensors and spinors Q Decomposition according to spin • Representations up to a sign

13 Temporal Order and Antiparticles* 61
The relativity of temporal order Q Absorption before emission ? Q The quantum paradox Q Antiparticles necessary in a relativistic quantum theory

Bibliography 63

References 64

PART TWO
THE GENERAL THEORY OF RELATIVITY

3 THE PRINCIPLE OF EQUIVALENCE 67

1 Statement of the Principle 67
Equivalence of gravitation and inertia rj Analogy with metric geometry Q The weak and strong principles of equivalence

2 Gravitational Forces 70
The equation of motion fj The affine connection Q The metric tensor Q Motion of photons • Light travel times Q Determination of the locally inertial frames

3 Relation between $g^{\wedge}$ and $r^{\wedge}_{v}$ 73
Derivatives of the metric in terms of the affine connection Q The Principle of Equivalence sharpened • Solution for the affine connection Q Inverse of the metric tensor Q Variational form of the equations of motion Q Geodesies

4 The Newtonian Limit 77
Relation between $<7_{00}$ and the Newtonian potential

5 Time Dilation 79
Time dilation in a gravitational field • Red shift of spectral lines • The solar red shift • White dwarf red shifts • The Pound-Rebka experiment • Red and blue shifts from artificial satellites Q Quantum derivation

6 Signs of the Times 85
Congruence relating the metric and Minkowski tensors Q Sylvester's law of inertia Q Signs of the metric eigenvalues

7 Relativity and Anisotropy of Inertia 86
Mach versus Newton • The Einstein compromise • The Hughes-Drever experiment

Bibliography 88

References 89

4 TENSOR ANALYSIS 91

1 The Principle of General Covariance 91
General covariance as an expression or the Principle of Equivalence • Contrast between general covariance and Lorentz invariance Q Dynamic symmetries Q General covariance sufficient only on small scales

2 Vectors and Tensors 93
Scalars, contra variant vectors, covariant vectors, tensors Q The metric and Kronecker tensors Q Invariant equations

3 Tensor Algebra 96
Linear combinations • Direct products • Contraction • Raising and lowering indices

4 Tensor Densities 98
Transformation of the metric determinant • Scalar densities Q Tensor densities fj Weights fj Volume elements as scalar densities Q The Levi-Civita tensor density Q Tensor density algebra

5 Transformation of the Affine Connection 100
The inhomogeneous transformation law Q] Transformation of derivatives of the metric tensor fj Alternative derivation of the relation between the affine connection and metric tensor Q Alternative derivation of the equation of motion

6 Covariant Differentiation 103
Transformation of derivatives of tensors Q] Covariant derivatives of tensors Q Covariant derivatives of tensor densities Q Linear combinations, direct products, contraction Q Covariant derivative of the metric tensor • Raising and lowering indices Q Algorithm for the effects of gravitation

7 Gradient, Curl, and Divergence 106
Covariant derivatives of scalars Q Antisymmetric covariant derivatives of vectors Q Covariant divergence of vectors Q Trace of the affine connection Q) Gauss's theorem Q Cyclic sums of covariant derivatives

8 Vector Analysis in Orthogonal Coordinates* 108
Diagonal metrics Q "Ordinary" components Q Volumes Q Scalar products Gradient, curl, and divergence • The Laplacian

9 Covariant Differentiation Along a Curve 110
Derivatives along a curve • Vectors Q] Tensors Q Relation to ordinary covariant derivatives Q Parallel transport

10 The Electromagnetic Analogy* 111
Gauge invariance • Gauge-covariant derivatives • Conserved currents

11 *p* -Forms and Exterior Derivatives* 113
p-Forms Q Exterior products Q Differential forms Q Exterior derivatives Q Poincare's lemma Q Converse to Poincare's lemma Q Orientable manifolds Q] Integrals of p-forms Q The generalized Stokes's tlieorem

References 119

5 EFFECTS OF GRAVITATION 121

1 Particle Mechanics 121
Parallel transport of velocity and spili • TorqitiTlMM force Q ThorhttN firtwessltfri[1] |~J

2 Electrodynamics 124
Generally covariant forms of the Maxwell equations Q Electromagnetic force four-vector Q Current four-vector Q Conservation law

3 Energy-Momentum Tensor 126
Covariant divergence of the energy-momentum tensor Q Ideal gas Q] Electromagnetic fields Q Total energy, momentum, angular momentum

4 Hydrodynamics and Hydrostatics 127
Energy-momentum tensor of perfect fluids Q The conservation laws Q Normalization of the velocity four-vector Q Hydrostatic equilibrium

References 129

6 CURVATURE 131

1 Definition of the Curvature Tensor 131
Second derivatives of the metric needed to construct new tensors Q Third derivatives of the transformed coordinate [3 The Riemann-ChristofFel curvature tensor Q] Uniqueness of generally covariant equations

2 Uniqueness of the Curvature Tensor 133
Uniqueness of the curvature tensor in locally inertial coordinates Q Uniqueness in general coordinates Q Ricci tensor Q Curvature scalar

3 Round Trips by Parallel Transport 135
Change in a vector parallel-transported around a closed curve Q Construction of vector fields with vanishing covariant derivatives

4 Gravitation versus Curvilinear Coordinates 138
Diagnosis of inertial and noninertial coordinates Q Necessary and sufficient conditions for absence of a gravitational field

5 Commutation of Covariant Derivatives 140
Commutator of covariant derivatives of a covariant vector FJ Extension to general tensors

I 6 Algebraic Properties of R_{XIIVK} 141
L Fully covariant curvature tensor • Symmetry, antisymmetry, and cyclicity •
I Uniqueness of the contracted tensors

7 Description of Curvature in *N* Dimensions* 142
The Petrov notation Q Number of algebraically independent components fj Special forms of the curvature tensor in one, two, and three dimensions Q Number of curvature scalars {T] The Weyl tensor

8 The Bianchi Identities 146
The general Bianchi identities • Contracted Bianchi identities

9 The Geometric Analogy* 147
Geometric concepts useful but not essential in general relativity • Geometric significance of the curvature tensor

10 Geodesic Deviation* 148
Relative motion of freely falling particles

Bibliography 149

References 149

7 EINSTEIN'S FIELD EQUATIONS 151

1 Derivation of the Field Equations 151
Energy-momentum tensor as the right-hand side of the field equation [J Properties of the left-hand side Q Einstein's field equations • Vanishing of the Ricci tensor in vacuum Q] The cosmological constant

2 Another Derivation* 155
Nonmetric tensors fj General linear equation fj Ambiguity removed by Newtonian limit

3 The Brans-Dicke Theory 157
Reciprocal gravitational constant as a scalar field • Properties of the scalar field energy-momentum tensor Q] Brans-Dicke field equations [J The Einstein limit

4 Coordinate Conditions 161
Bianchi identities and nonuniqueness of solutions of the Einstein equations Q Analogy with electrodynamics • Harmonic coordinate conditions • Wave equations for the coordinates

5 The Cauchy Problem 163
Constraints on the initial data fj Ambiguity in the solutions Q Removal of the ambiguity by coordinate conditions fj Stability of the initial constraints

6 Energy, Momentum, and Angular Momentum of Gravitation 165
Quasilinear form of the Einstein field equations Q Energy-momentum tensor of gravitation • Total energy, momentum, and angular momentum of an isolated system and its gravitational field Q Quadratic approximation to the energy-momentum tensor of gravitation Q Lorentz covariance and convergence of the total energy and momentum • Calculation of the total energy, momentum, and angular momentum from the asymptotic field Q Positivity of the energy • Invariance of the total energy and momentum under coordinate transformations that approach the identity at infinity Q Additivity of the energy and momentum Q Yet another derivation of the field equations

Bibliography 171

References 172

PART THREE
APPLICATIONS OF GENERAL RELATIVITY

8 CLASSIC TESTS OF EINSTEIN'S THEORY 175

1 The General Static Isotropic Metric 175
The metric in terms of four unknown functions fj Elimination of off-diagonal terms Q The standard form Q The isotropic form Q Metric inverse and determinant • Affine connection Q] Ricci tensor Q Harmonic coordinates

2 The Schwarzschild Solution 179
Vacuum equations in "standard" coordinates Q Solution for the metric Q Isotropic and harmonic forms Q Identification of the integration constant

3 Other Metrics 182
The Robertson expansion Q Conversion to standard and harmonic forms • Reduction to two unknowns

4 General Equations of Motion 185
Orbital equations in standard coordinates Q Constants of the motion Q Particle in a circular orbit Q Orbit shapes

5 Unbound Orbits: Deflection of Light by the Sun 188
Impact parameter and asymptotic velocity [[] General orbit shapes Q Robertson expansion Q Deflection of light by the sun • Conceptual problems • Observational problems • Summary of optical observations • Long baseline interferometry Q Radio observations

6 Bound Orbits: Precession of Perihelia 194
Evaluation of the constants of motion Q] Orbit shapes and precession per revolution Q Robertson expansion Q Conceptual problems Q Theory and observation for Mercury, Venus, Earth, and Icarus • Newtonian perturbations • Solar oblateness

7 Radar Echo Delay 201
Time as a function of position Q The Robertson expansion • Time delay • Observational difficulties Q Comparison of theory and observation fj Echo arrival times in a semirealistic model

8 The Schwarzschild Singularity* 207
Singularity of the metric at the Schwarzschild radius Q Practical irrelevance of the singularity • Singularity-free coordinate systems

Bibliography 209

References 209

9 POST-NEWTONIAN CELESTIAL MECHANICS 211

1 The Post-Newtonian Approximation 212
Expansions in powers of the typical velocity Q Post-Newtonian approximation • Terms needed in the affine connection • Terms needed in the metric • Expansion of the Ricci tensor • Expansion of the energy-momentum tensor • Post-Newtonian field equations • Solutions • Scalar potential, vector potential, **and** second potential

2 Particle and Photon Dynamics 220
Post-Newtonian equation of motion Q Proper time fj Single-particle Lagrangian fj Equation of motion of photons

3 The Energy-Momentum Tensor 222
Newtonian conservation laws Q Post-Newtonian conservation laws Q Energy-momentum tensor for freely falling particles *[J* The Post-Newtonian program

4 Multipole Fields 225
The metric far from a finite body fj The metric anywhere outside a spherical body FJ The metric outside a rotating sphere

5 Precession of Perihelia 230
Runge-Lenz vector Q Additivity of contributions to the precession \^\ Precession of perihelia for a spherical nonrotating sun Q Effect of solar rotation

6 Precession of Orbiting Gyroscopes 233
Equation of motion of the spin fj Redefinition of the spin fj Observability of the precession Q Geodetic precession Q Hyperfine precession fj Satellite experiments

7 Spin Precession and Mach's Principle* 239
Vanishing of precession in inertial frames fj The Lense-Thirring effect Q The Kerr solution • The Brill-Cohen solution

8 Post-Newtonian Hydrodynamics* 241
Post-Newtonian program for cold fluids FJ Newtonian conservation law Q Post-Newtonian field equations Q Fluids with nonvanishing temperature

9 Approximate Solutions to the Brans-Dicke Theory 244
Post-Newtonian field equations FJ Solution for a static spherically symmetric mass *£2* Evaluation of the Robertson parameters fj Effects of rotation Q Effective "constant" of gravitation

Bibliography 248

Reference* 249

IO GRAVITATIONAL RADIATION 251

1 The Weak-Field Approximation 252
Einstein equations for a weak field Q Gauge invariance fj Harmonic coordinates Q Retarded wave solutions Q Homogeneous solutions

2 Plane Waves 255
Physical and unphysical components of the polarization tensor Helicities Analogy with electromagnetic plane waves

3 Energy and Momentum of Plane Waves 259
Gauge invariance of the energy-momentum tensor FJ Evaluation of the energy-momentum tensor

4 Generation of Gravitational Waves 260
Power per solid angle emitted by a periodic source fj Energy per solid angle emitted by a Fourier integral source • Emission of gravitational radiation in collisions fj Gravitational radiation from the sun

5 Quadrupole Radiation 267
Small sources Q Total power emitted by a periodic source Q Total energy emitted by a Fourier integral source fj Comments on calculation of the quadrupole tensor Q Radiation by a plane sound wave fj Weber's cylinders Q Radiation by a rotating body FJ Negligibility of gravitational radiation in celestial mechanics Q Pulsars

6 Scattering and Absorption of Gravitational Radiation 274
Scattering amplitude fj Scattering cross-section Q Total cross-section Q Optical theorem

7 Detection of Gravitational Radiation 276
Resonant quadrupole antennas Q Total and scattering cross-sections • Longitudinal antennas fj Spherical antennas fj Tuning *£2* Detection of the Crab pulsar [3 Steady and burst sources • Earth and moon as antennas FJ Weber's experiments Q Future experiments

:. S Quantum Theory of Gravitation* 285
JrChravitons F.B Number density in plane waves Q Graviton emission in atomic [Mftoltisions [J Graviton emission in particle collisions Q Infrared divergences Q itaneous and induced emission • Quantum gravitational field FJ Problems th Lorentz covariance Q Approaches to the quantization problem FJ Necessity • the Principle of Equivalence

Gravitational Disturbances in Gravitational Fields* 290
htini identity fj Einstein's equations for small perturbations Q Equivalent | The Lie derivative

tiy 293

294

II STELLAR EQUILIBRIUM AND COLLAPSE 297

1 Differential Equations for Stellar Structure 299

The fundamental equation of relativistic stellar equilibrium FJ Isentropic stars [J The interior metric fj The total mass, nucleon number, thermal energy, gravitational energy Q Stellar structure determined by central density

2 Stability 304

Transition from stability to instability when the energy is stationary fj Variational form of the equilibrium condition

3 Newtonian Stars: Polytropes and White Dwarfs 308

The fundamental equation of nonrelativistic stellar equilibrium £2 Polytropes fj The Lane-Emden function Q Masses and radii as functions of central density fj Thermal and gravitational energies as functions of mass and radius Q Stability Q] Vibration and rotation frequencies FJ White dwarfs fj The Chandrasekhar limit Q The surface potential

4 Neutron Stars 317

Neutron degeneracy pressure f J Analogy with white dwarfs fj Mass and radius as functions of central density fj The limiting configuration FJ Stability FJ The Oppenheimer-Volkoff limit Q Hydrogen contamination fj Beta stability • The minimum mass Q Muon and baryon contamination fj] More realistic models Q Pulsars

5 Supermassive Stars 325

Radiation-dominated pressure Q Newtonian structure FJ General relativity and stability

6 Stars of Uniform Density 330

Solution of the fundamental equation Q Upper limit on the surface red shift fj Large central red shifts

7 Time-Dependent Spherically Symmetric Fields 335

The standard form Q Elements of the Ricci tensor Q The Birkhoff theorem

8 Comoving Coordinates 338

The comoving coordinate systems fj Gaussian and Gaussian normal coordinates fj Elements of the Ricci tensor

9 Gravitational Collapse 342

Interior solution in comoving coordinates Q Collapse in a finite proper time fj] Matching to the exterior solution FJ Evolution of the surface red shift Q External field measurements Q Carter's theorem Q] Efficiency of energy production FJ Inevitability of collapse FJ Black holes

Bibliography 350

References 352

PART FOUR
FORMAL DEVELOPMENTS

12 THE ACTION PRINCIPLE 357

1 The Matter Action: An Example 358

Equations of motion and field equations for a collisionless plasma fj Tentative action Q Principle of stationary action Q Verification of the action principle

2 General Definition of T''^{ν} 360

Energy-momentum tensor as the functional derivative of the action with respect to the metric FJ Verification for a collisionless plasma fj] Electric current as the functional derivative of the action with respect to the vector potential

3 General Covariance and Energy-Momentum Conservation 361

Infinitesimal coordinate transformations of dynamical variables and the metric • General covariance implies conservation of the energy-momentum tensor Q Gauge invariance implies conservation of the electric current

4 The Gravitational Action 364

The action for a gravitational field Q Derivation of the Einstein equations [[] Derivation of the Bianchi identities

5 The Tetrad Formalism* 365

| Spinors and general covariance • Definition of the tetrad • Scalar components of fields fj General covariance and local Lorentz covariance Q Coordinate i • Lorentz tensors and spinors • Coordinate scalar derivatives • Defini- i of the energy-momentum tensor • Symmetry and conservation of the energy- nentum tensor Q Derivation of the field equations

373

13 SYMMETRIC SPACES 375

1 Killing Vectors 375

Isometries Q] Killing vectors • Maximum number of independent Killing vectors • Homogeneous spaces fj Isotropic spaces Q Maximally symmetric spaces Q Integrability conditions

2 Maximally Symmetric Spaces: Uniqueness 381

Structure of the Riemann-Christoffel tensor for maximally symmetric spaces FJ Constancy of the curvature Q] Equivalence of maximally symmetric metrics with equal curvature

3 Maximally Symmetric Spaces: Construction 385

Embedding in $(N + 1)$ dimensions fj Calculation of the metric fj Rotations and quasitranslations • Killing vectors • Geodesies [J Curvature • Locally Euclidean maximally symmetric spaces FJ Global properties Q Volume FJ The deSitter metric

4 Tensors in a Maximally Symmetric Space 392

Form-invariant tensors FJ Maximally form-invariant tensors

5 Spaces with Maximally Symmetric Subspaces 395

Canonical form of the metric Q Spherically symmetric spaces and space-times fj Spherically symmetric and homogeneous space-times

Bibliography 404

References 404

PART FIVE
COSMOLOGY

14 COSMOGRAPHY 4O7

1 The Cosmological Principle 409

Cosmic standard coordinates fj Equivalent coordinates Q Isometries and form invariance Q] Isotropy and homogeneity

2 The Robertson-Walker Metric 412

General form of the metric Q Volume and circumference of space Q Cosmic scale factor Q Rotations and quasitranslations Q Comoving coordinates Q Free fall of the fundamental observers fj Perfect fluid form of the energy-momentum tenso; • Conservation of energy and galaxies fj Proper distance

3 The Red Shift 415
Relation between photon departure and arrival times and light souroe location Q The red-shift parameter *z* fj Red shifts as Doppler shifts [] Discovery of the red shifts FJ Slipher, Wirtz, Lundmark, and Hubble

4 Measures of Distance 418
Light paths • Parallax and parallax distance Q Apparent luminosity and luminosity distance • Angular diameter and angular diameter distance FJ Proper motion and proper-motion distance FJ Relations among the measures of distance Q Sources with smooth edges Q Sources with smooth spectra • Astronomical unit, parsec, apparent magnitude, absolute magnitude, distance modulus, color index

5 The Cosmic Distance Ladder 427
Kinematic Methods: The sun, trigonometric parallax, moving clusters, the Hyades, statistical proper motion studies FJ Main-Sequence Photometry: The Hertzsprung-Russell relation, open clusters and globular clusters, stellar populations fj] Variable Stars: R R Lyrae stars, classical Cepheids, W Virginis stars, the period-luminosity relation, recalibration of the distance scale, source of the discrepancy, relative sizes of galaxies • Novae, H II regions, Brightest stars, Globular Clusters, and so on: Distance to the Virgo cluster Q Brightest Galaxies: Absolute magnitude of NGC4472, Scott effect

6 The Red-Shift Versus Distance Relation 441
Hubble constant and deacceleration parameter Q Expansion in powers of *z* for time of flight, radial coordinate, luminosity distance, apparent luminosity, apparent magnitude • Problems in the measurement of H_o and q_0: Galactic rotation, aperture, fc-term, absorption, uncertainty in *L*, Scott effect, shear field, galactic evolution • The Hubble program FJ] Recent measurements Q Quasi-stellar objects Q Functional equation for the scale factor fj Rate of change of red shifts

7 Number Counts 451
Number counts as a function of red shift and apparent luminosity or flux density Q Spectral index Q Source evolution • Series expansions for nearby sources • Radio source surveys FJ Excess of faint sources

8 The Steady State Cosmology 459
The perfect cosmological principle Q The steady state metric • Continuous creation FJ Red shift versus luminosity distance • Number counts

Bibliography 464

References 466

15 COSMOLOGY: THE STANDARD MODEL 469

1 Einstein's Equations 470

Robertson-Walker metric, affine connection, Ricci tensor Q First-order field equation fj Upper limit on the age of the universe • Curvature and the future of the universe [J Mach's principle Q Newtonian cosmology

2 Density and Pressure of the Present Universe 475

Critical density • Density of galactic mass • Intergalactic mass inside and outside galactic clusters • Radio, microwave, far-infrared, optical, X-ray, y-ray, and cosmic ray densities Q Pressure

3 The Matter-Dominated Era 481

Time as a function of *R* Q Age of the universe fj Red shift versus luminosity distance and parallax distance FJ Number counts Q Measurements of the age of the universe: uranium dating, globular clusters Q Particle and event horizons

4 Intergalactic Emission and Absorption Processes 491

Optical depth Q Stimulated emission Q The Einstein relation Q Isotropic background fj Resonant absorption FJ Absorption trough fj] Absorption and emission of 21-cm radiation fj Search for Lyman a absorption Q Isotropic X-ray background FJ Thermal history of intergalactic hydrogen Q Thomson scattering • Time delay by intergalactic plasma • Extragalactic pulsars

5 The Cosmic Microwave Radiation Background 506

Black-body radiation fj Black-body temperature and antenna temperature FJ Models with *TR* constant • Specific photon entropy • Hot models • Estimates of black-body temperature in the cosmological theory of element synthesis fj Observation of the cosmic microwave radiation background Q Absorption by interstellar molecules fj Summary of measurements of black-body temperature Q Gray-body radiation and the Rayleigh-Jeans law • Expected departures from the black-body spectrum fj Anisotropies of small and large angular scale • Velocity of the solar system fj Homogenization of the universe fj Discrete source models [J Scattering of cosmic ray electrons, electrons in radio sources, cosmic ray photons, and protons

6 Thermal History of the Early Universe 528

Summary of the early history of the "universe • Time scale • Thermal equilibrium • Vanishing chemical potentials Q The lepton-photon era fj Conditions at 10^{12}°K FJ Decoupling of neutrinos fj Neutrino temperature after electron-positron annihilation fj] Time as a function of temperature fj Degenerate neutrinos • Measurements of neutrino degeneracy

7 Helium Synthesis 545

Theories of nucleosynthesis Q Neutron-proton conversion rates fj] Neutron abundance as a function of time fj Equilibrium abundances of complex nuclei fj] The deuterium bottleneck Q Helium production at 10^{9}°K FJ Measurements of the cosmic helium abundance: stellar masses and luminosities, solar neutrino experiments, direct solar measurements, theory of globular clusters, stellar spectra, spectroscopy of interstellar matter, extragalactic measurements Q Modifications in the expected helium abundance: cool models, fast or slow models, neutrino interactions, degeneracy

8 The Formation of Galaxies 561

Jeans's theory fj Analogy with plasma waves Q Acoustic limit Q Jeans's mass Q Effect of black-body background radiation fj Phases of galactic growth fj Acoustic damping Q Critical mass Q Observation of protogalactic fluctuations as small-scale anisotropies in the microwave background

9 Newtonian Theory of Small Fluctuations 571

Unperturbed solutions Q First-order equations Q Plane-wave solutions fj Rotational modes FJ Differential equation for compressional modes Q Zero-pressure solutions: growth from recombination to the present fj Zero-curvature solutions: stable and unstable modes

10 General-Relativistic Theory of Small Fluctuations 578

Dissipative terms in the energy-momentum tensor fj Unperturbed solutions • : Equivalent solutions fj Elimination of space-time and time-time components FJ ' Perturbations in the affine connection, Ricci tensor, source tensor fj First-order stein equations and equations of motion Q Unphysical solutions Q Plane I'fraves • Radiative modes: absorption and instability of gravitational waves • |Rotational modes • Compressional modes: four coupled equations, long wave-gth limit, growth at early times

11 The Very Early Universe 588

nentary and composite particle models Q Fossil quarks and gravitons Q] Heat luction by bulk viscosity • Symmetric cosmologies • Necessity of a past nlarity fj Necessity of a future singularity fj Periodic cosmologies

aphy 597

599

16 COSMOLOGY: OTHER MODELS 611

1 Naive Models: The Olbers Paradox 611

Infinite density of starlight in an infinite eternal universe [J Effects of absorption Q Radiation and neutrino densities in modern cosmologies

2 Models with a Cosmological Constant 613

Effective density and pressure Q Static Einstein model fj deSitter model Q Lemaitre models fj Coasting period [J Eddington-Lemaitre model fj Instability of the static model

3 The Steady State Model Revisited 616

Correction term in the field equation Q The C-field Q Density of the universe fj Continuous creation of background radiation fj Action-at-a-distance formulations of electrodynamics

4 Models with a Varying Constant of Gravitation 619

Weakness of gravitation Q Numerical coincidences Q Dirac's theory: R and 6? versus t • The Brans-Dicke theory: field equations, initial constraint, solutions for zero pressure and curvature, nucleosynthesis, decrease in Q fj Upper limits on the rate of change of G: radar observations of Mercury and Venus, lunar laser ranging, solar eclipse records, fossil corals, effects on the earth's crust, stellar evolution, early temperature of the earth

Bibliography 631

References 631
