

Lecture Notes in Artificial Intelligence

Edited by J. Siekmann

Subseries of Lecture Notes in Computer Science

353

Steffen Hölldobler

Foundations of Equational
Logic Programming

Springer-Verlag

Berlin Heidelberg New York London Paris Tokyo Hong Kong

Contents

1.	Introduction	1
2.	Preliminaries	15
2.1	Terms, Atoms, and Equations	17
2.2	Substitutions	20
3.	Equational Logic Programming	24
3.1	Equational Logic Programs	26
3.2	Model Theory	29
3.3	Fixpoint Theory	40
3.4	Proof Theory	45
3.4.1	Unification	48
3.4.2	SLD-Resolution	53
4.	Universal Unification	65
5.	SLDE-Resolution	76
6.	Paramodulation	85
6.1	Fixpoint Characterization	88
6.2	Paramodulation	94
6.3	Confluent Theories	117
6.4	Term Rewriting Systems	121
6.5	Narrowing	136
6.5.1	Canonical Term Rewriting Systems	144
6.5.2	Narrowing and Rewriting	154
6.5.3	Completely Defined Term Rewriting Systems	159
6.6	The Unification and Matching Problem for Canonical Theories	161
6.6.1	A Decidability Metatheorem	162
6.6.2	The Undecidability of the Unification and Matching Problem	165
6.7	Summary	172

7.	Universal Unification by Complete Sets of Transformations	174
7.1	The Transformation Rules	176
7.2	Soundness of the Transformation Rules	182
7.3	Completeness of the Transformation Rules	187
8.	Lazy Resolution and Complete Sets of Inference Rules for Horn Equational Theories	201
9.	Conclusion	208
9.1	Summary	209
9.2	Discussion	214
9.3	Open Problems	227
	References	231
	Index	242
	The Inference Rules	246
	Examples	247
	Notations	248
