Siedlungswasserwirtschaft und Abfalltechnik der
Universität Hannover

**Performance prediction of full-scale
biological nutrient removal systems
using complex activated sludge models**

Jacek Makinia

Table of Contents

1. INTRODUCTION	1
1.1. Background	1
1.2. Motivation and problem formulation	5
1.3. Research goals and objectives	9
1.4. Scope of the work	10
2. THEORETICAL BACKGROUND	11
2.1. Matrix presentation of complex activated sludge models	11
2.2. Review of approaches to modeling principal biochemical processes incorporated in biokinetic models of the activated sludge process	17
2.2.1. Hydrolysis of slowly biodegradable organic compounds	17
2.2.2. Conversion of "complex" readily biodegradable substrate to VFA (fermentation)	23
2.2.3. Adsorption of substrates	25
2.2.4. Storage of substrates	28
2.2.5. Growth of microorganisms	36
2.2.6. Disappearance (loss) of microorganism biomass and other cell internal components	46
2.2.7. Nitrification	50
2.2.8. Denitrification	59
2.2.9. Enhanced biological phosphate removal (EBPR)	63
2.2.10. Chemical precipitation of phosphorus	80
2.3. Development of complex mechanistic models for BNRAS systems	84
2.4. Secondary clarifier	101
2.4.1. Modeling clarification and thickening	101
2.4.2. Biological processes in the secondary clarifier	104
2.5. Organization of the simulation study for activated sludge systems	105
2.5.1. Approaches to a systematic organization of simulation studies	105
2.5.2. Data quality control (collection, verification and reconciliation)	113
2.5.3. Hydrodynamic mixing model	115
2.5.4. Influent wastewater characterization	116
2.5.5. Determination of kinetic and stoichiometric parameters in the biokinetic models	131

2.5.6. Sensitivity analysis	138
2.6. Review of practical model applications	139
3. MATERIALS AND METHODS	144
3.1. Process description and performance of the studied WWTPs	144
3.1.1. Hanover-Gümmerwald full-scale pilot WWTP	144
3.1.2. Wschod WWTP in Gdansk	148
3.1.3. Debogorze WWTP in Gdynia	151
3.2. Description of the laboratory experiments and additional full-scale measurement campaigns	154
3.2.1. Experimental set-up	154
3.2.2. Full-scale measurement campaigns	157
3.3. Simulation tool	160
3.4. Organization of the simulation study at the Hanover-Gümmerwald full-scale pilot WWTP	160
3.4.1. Collection of plant routine data	160
3.4.2. Data quality evaluation	161
3.4.3. Procedure of model calibration and validation	162
3.5. Organization of the simulation study at the two full-scale plants in northern Poland (Wschod WWTP and Debogorze WWTP)	170
3.5.1. Collection of plant routine data	170
3.5.2. Data quality evaluation	170
3.5.3. Procedure of model calibration and validation	170
3.6. Approach to estimation of the longitudinal dispersion coefficient, E_L , from tracer studies and empirical formulae	176
3.6.1. Estimation of the longitudinal dispersion coefficient, E_L , from tracer studies	176
3.6.2. Estimation of the longitudinal dispersion coefficient, E_L , from empirical formulae	180
4. RESULTS AND DISCUSSION	184
4.1. Evaluation of the hydrodynamic mixing conditions	184
4.2. Gümmerwald full-scale pilot WWTP	188
4.2.1. Data quality evaluation	188
4.2.2. Wastewater and biomass characterization	191
4.2.3. Determination of the hydraulic conditions in the aerobic compartment	195
4.2.4. Calibration of the biokinetic model	197
4.2.5. Model validation	204

4.2.6. Sensitivity analysis	209
4.2.7. Example of model application (estimation of maximum allowable flow rates during stormwater conditions)	212
4.3. Large WWTPs in northern Poland (Wschod in Gdansk and Debogorze in Gdynia)	216
4.3.1. Data quality evaluation	216
4.3.2. Preliminary steady-state simulations	216
4.3.3. Influent (settled) wastewater characterization	218
4.3.4. Evaluation of the biochemical process rates based on the results of batch tests	221
4.3.5. Calibration of the biokinetic models using the results of batch experiments	230
4.3.6. Validation of the biokinetic models using the results of batch experiments	242
4.3.7. Validation of the biokinetic models using the results of full-scale measurements	249
4.3.8. Sensitivity analysis	256
4.3.9. Example of model application at the Wschod WWTP in Gdansk	262
4.3.10. Example of model application at the Debogorze WWTP in Gdynia	267
4.4. Similarities and differences between the examined biokinetic models	275
4.5. Comparison of ASM2d predictions with the hydraulic models based on different numbers of tanks-in-series	279
5. CONCLUSIONS	285
5.1. General considerations resulting from the literature review	285
5.2. Hanover-Gümmerswald pilot plant	286
5.3. Two full-scale WWTPs in northern Poland	287
5.4. Perspectives on the future research	288
