Fluid Flow Through Porous
Macromolecular Systems

Springer-Verlag
Berlin Heidelberg New York 1980

Inventar Nr. 10718/PC 1

CONTENTS

Part A: General Considerations

1. Introduction	1
2. Operational definition of the permeability	5
3. Relation between the permeability and the sedimentation coefficient	7
4. Experimental determination of the permeability	9
5. Macroscopic derivation of the fundamental equation	12
6. The Oseen tensor	15
7. Microscopic derivation of the fundamental equation	18

Part B: Flow through isolated macromolecular coils in solution

8. The Einstein relations	21
9. Rotational diffusion coefficient: general theory	23
10. Rotational diffusion coefficient of a uniform sphere	26
11. Translational diffusion coefficient: general theory	29
12. Translational diffusion coefficient of a uniform sphere	32
13. The free random walk model and the Gaussian coil	34
14. Translational diffusion coefficient of a Gaussian coil	41
15. Viscosity: general theory	44
16. Viscosity of a dilute solution of uniformly porous spheres	48
17. Viscosity of Gaussian coils	51
18. Comparison with experimental data	53

Part C: Hydrodynamics of a permeable complex in the cell membrane

19. General properties of cell membranes	54
20. The Bretscher flow hypothesis	56
21. Equilibrium distribution of diffusing particles	58
22. Cap formation	60
23. General theory of the rotational diffusion coefficient	61
24. Rotational diffusion coefficient of a uniform disk	64
25. General theory of the translational diffusion coefficient	66
26. Translational diffusion coefficient of a uniform disk	69
27. Experiments on membrane diffusion	74
28. Discussion and outlook	76

Appendix: Comments on entanglements and the excluded volume problem

A. Importance of these problems	78
B. The two-dimensional simple entanglement problem	78
C. Role of dimension in the excluded volume problem	82
D. The critical exponent ν	83
E. The self-consistent field approximation	83
F. The cluster expansion	86
G. Conjecture about the non-Gaussian statistics	87
H. The renormalization group approach	88
I. Markovian character of two-dimensional excluded volume problem	88
J. On a remarkable class of two-dimensional random walks	92
Bibliography	96
Index	100
