<b>List of algorithms</b>	<b>xiv</b>
<b>Preface</b>	<b>xvii</b>
<b>Possible course outlines</b>	<b>xxii</b>
<b>1 Introduction</b>	<b>1</b>
1.1 Motivation	1
1.2 Why is computer vision difficult?	3
1.3 Image representation and image analysis tasks	5
1.4 Summary	9
1.5 References	10
<b>2 The image, its representations and properties</b>	<b>11</b>
2.1 Image representations, a few concepts	11
2.2 Image digitization	14
2.2.1 Sampling	14
2.2.2 Quantization	15
2.3 Digital image properties	16
2.3.1 Metric and topological properties of digital images	17
2.3.2 Histograms	24
2.3.3 Entropy	25
2.3.4 Visual perception of the image	25
2.3.5 Image quality	28
2.3.6 Noise in images	29
2.4 Color images	31
2.4.1 Physics of color	31
2.4.2 Color perceived by humans	33
2.4.3 Color spaces	37
2.4.4 Palette images	39
2.4.5 Color constancy	40
2.5 Cameras: an overview	41
2.5.1 Photosensitive sensors	41
2.5.2 A monochromatic camera	43
2.5.3 A color camera	45
2.6 Summary	46
2.7 References	47

<b>3 The image, its mathematical and physical background</b>	<b>49</b>
3.1 Overview	49
3.1.1 Linearity	50
3.1.2 The Dirac distribution and convolution	50
3.2 Linear integral transforms	52
3.2.1 Images as linear systems	52
3.2.2 Introduction to linear integral transforms	53
3.2.3 1D Fourier transform	53
3.2.4 2D Fourier transform	58
3.2.5 Sampling and the Shannon constraint	61
3.2.6 Discrete cosine transform	65
3.2.7 Wavelet transform	66
3.2.8 Eigen-analysis	72
3.2.9 Singular value decomposition	73
3.2.10 Principal component analysis	74
3.2.11 Other orthogonal image transforms	77
3.3 Images as stochastic processes	77
3.4 Image formation physics	80
3.4.1 Images as radiometric measurements	81
3.4.2 Image capture and geometric optics	81
3.4.3 Lens aberrations and radial distortion	85
3.4.4 Image capture from a radiometric point of view	87
3.4.5 Surface reflectance	91
3.5 Summary	95
3.6 References	96
<b>4 Data structures for image analysis</b>	<b>98</b>
4.1 Levels of image data representation	98
4.2 Traditional image data structures	99
4.2.1 Matrices	99
4.2.2 Chains	102
4.2.3 Topological data structures	104
4.2.4 Relational structures	105
4.3 Hierarchical data structures	106
4.3.1 Pyramids	106
4.3.2 Quadtrees	108
4.3.3 Other pyramidal structures	109
4.4 Summary	110
4.5 References	111
<b>5 Image pre-processing</b>	<b>113</b>
5.1 Pixel brightness transformations	114
5.1.1 Position-dependent brightness correction	114
5.1.2 Gray-scale transformation	115
5.2 Geometric transformations	118
5.2.1 Pixel co-ordinate transformations	119
5.2.2 Brightness interpolation	121

5.3	Local pre-processing	123
5.3.1	Image smoothing	124
5.3.2	Edge detectors	132
5.3.3	Zero-crossings of the second derivative	138
5.3.4	Scale in image processing	142
5.3.5	Canny edge detection	144
5.3.6	Parametric edge models	147
5.3.7	Edges in multi-spectral images	147
5.3.8	Local pre-processing in the frequency domain	148
5.3.9	Line detection by local pre-processing operators	154
5.3.10	Detection of corners (interest points)	156
5.3.11	Detection of maximally stable extremal regions	160
5.4	Image restoration	162
5.4.1	Degradations that are easy to restore	164
5.4.2	Inverse filtration	165
5.4.3	Wiener filtration	165
5.5	Summary	167
5.6	References	169
<b>6</b>	<b>Segmentation I</b>	<b>175</b>
6.1	Thresholding	176
6.1.1	Threshold detection methods	179
6.1.2	Optimal thresholding	180
6.1.3	Multi-spectral thresholding	183
6.2	Edge-based segmentation	184
6.2.1	Edge image thresholding	185
6.2.2	Edge relaxation	188
6.2.3	Border tracing	191
6.2.4	Border detection as graph searching	197
6.2.5	Border detection as dynamic programming	207
6.2.6	Hough transforms	212
6.2.7	Border detection using border location information	221
6.2.8	Region construction from borders	222
6.3	Region-based segmentation	223
6.3.1	Region merging	225
6.3.2	Region splitting	227
6.3.3	Splitting and merging	229
6.3.4	Watershed segmentation	233
6.3.5	Region growing post-processing	235
6.4	Matching	237
6.4.1	Matching criteria	238
6.4.2	Control strategies of matching	240
6.5	Evaluation issues in segmentation	241
6.5.1	Supervised evaluation	241
6.5.2	Unsupervised evaluation	245
6.6	Summary	246
6.7	References	249

<b>7 Segmentation II</b>	<b>257</b>
7.1 Mean Shift Segmentation	257
7.2 Active contour models—snakes	265
7.2.1 Traditional snakes and balloons	265
7.2.2 Extensions	269
7.2.3 Gradient vector flow snakes	270
7.3 Geometric deformable models—level sets and geodesic active contours	275
7.4 Fuzzy Connectivity	283
7.5 Towards 3D graph-based image segmentation	291
7.5.1 Simultaneous detection of border pairs	292
7.5.2 Sub-optimal surface detection	297
7.6 Graph cut segmentation	298
7.7 Optimal single and multiple surface segmentation	306
7.8 Summary	318
7.9 References	320
<b>8 Shape representation and description</b>	<b>328</b>
8.1 Region identification	332
8.2 Contour-based shape representation and description	335
8.2.1 Chain codes	335
8.2.2 Simple geometric border representation	336
8.2.3 Fourier transforms of boundaries	339
8.2.4 Boundary description using segment sequences	341
8.2.5 B-spline representation	344
8.2.6 Other contour-based shape description approaches	347
8.2.7 Shape invariants	347
8.3 Region-based shape representation and description	351
8.3.1 Simple scalar region descriptors	352
8.3.2 Moments	357
8.3.3 Convex hull	360
8.3.4 Graph representation based on region skeleton	365
8.3.5 Region decomposition	368
8.3.6 Region neighborhood graphs	369
8.4 Shape classes	370
8.5 Summary	371
8.6 References	373
<b>9 Object recognition</b>	<b>380</b>
9.1 Knowledge representation	381
9.2 Statistical pattern recognition	386
9.2.1 Classification principles	387
9.2.2 Classifier setting	390
9.2.3 Classifier learning	393
9.2.4 Support Vector Machines	396
9.2.5 Cluster analysis	402
9.3 Neural nets	404
9.3.1 Feed-forward networks	405

9.3.2	Unsupervised learning	407
9.3.3	Hopfield neural nets	409
9.4	Syntactic pattern recognition	410
9.4.1	Grammars and languages	412
9.4.2	Syntactic analysis, syntactic classifier	414
9.4.3	Syntactic classifier learning, grammar inference	417
9.5	Recognition as graph matching	418
9.5.1	Isomorphism of graphs and sub-graphs	419
9.5.2	Similarity of graphs	423
9.6	Optimization techniques in recognition	424
9.6.1	Genetic algorithms	425
9.6.2	Simulated annealing	427
9.7	Fuzzy systems	430
9.7.1	Fuzzy sets and fuzzy membership functions	430
9.7.2	Fuzzy set operators	433
9.7.3	Fuzzy reasoning	433
9.7.4	Fuzzy system design and training	437
9.8	Boosting in pattern recognition	438
9.9	Summary	441
9.10	References	444

## **10 Image understanding** 450

10.1	Image understanding control strategies	452
10.1.1	Parallel and serial processing control	452
10.1.2	Hierarchical control	453
10.1.3	Bottom-up control	453
10.1.4	Model-based control	454
10.1.5	Combined control	455
10.1.6	Non-hierarchical control	458
10.2	RANSAC: Fitting via random sample consensus	461
10.3	Point distribution models	464
10.4	Active Appearance Models	475
10.5	Pattern recognition methods in image understanding	486
10.5.1	Classification-based segmentation	486
10.5.2	Contextual image classification	488
10.6	Boosted cascade of classifiers for rapid object detection	492
10.7	Scene labeling and constraint propagation	497
10.7.1	Discrete relaxation	498
10.7.2	Probabilistic relaxation	500
10.7.3	Searching interpretation trees	503
10.8	Semantic image segmentation and understanding	504
10.8.1	Semantic region growing	506
10.8.2	Genetic image interpretation	507
10.9	Hidden Markov models	516
10.9.1	Applications	522
10.9.2	Coupled HMMs	523
10.9.3	Bayesian belief networks	524
10.10	Gaussian mixture models and expectation-maximization	526

10.11 Summary	534
10.12 References	537
<b>11 3D vision, geometry</b>	<b>546</b>
11.1 3D vision tasks	547
11.1.1 Marr's theory	549
11.1.2 Other vision paradigms: Active and purposive vision	551
11.2 Basics of projective geometry	553
11.2.1 Points and hyperplanes in projective space	553
11.2.2 Homography	555
11.2.3 Estimating homography from point correspondences	558
11.3 A single perspective camera	561
11.3.1 Camera model	561
11.3.2 Projection and back-projection in homogeneous coordinates	565
11.3.3 Camera calibration from a known scene	565
11.4 Scene reconstruction from multiple views	566
11.4.1 Triangulation	566
11.4.2 Projective reconstruction	568
11.4.3 Matching Constraints	569
11.4.4 Bundle adjustment	571
11.4.5 Upgrading the projective reconstruction, self-calibration	571
11.5 Two cameras, stereopsis	573
11.5.1 Epipolar geometry; fundamental matrix	573
11.5.2 Relative motion of the camera; essential matrix	575
11.5.3 Decomposing the fundamental matrix to camera matrices	577
11.5.4 Estimating the fundamental matrix from point correspondences	578
11.5.5 Rectified configuration of two cameras	579
11.5.6 Computing rectification	581
11.6 Three cameras and trifocal tensor	583
11.6.1 Stereo correspondence algorithms	584
11.6.2 Active acquisition of range images	591
11.7 3D information from radiometric measurements	594
11.7.1 Shape from shading	595
11.7.2 Photometric stereo	598
11.8 Summary	600
11.9 References	601
<b>12 Use of 3D vision</b>	<b>606</b>
12.1 Shape from X	606
12.1.1 Shape from motion	606
12.1.2 Shape from texture	613
12.1.3 Other shape from X techniques	614
12.2 Full 3D objects	617
12.2.1 3D objects, models, and related issues	617
12.2.2 Line labeling	618
12.2.3 Volumetric representation, direct measurements	620
12.2.4 Volumetric modeling strategies	622
12.2.5 Surface modeling strategies	624

12.2.6	Registering surface patches and their fusion to get a full 3D model	626
12.3	3D model-based vision	632
12.3.1	General considerations	632
12.3.2	Goad's algorithm	633
12.3.3	Model-based recognition of curved objects from intensity images	637
12.3.4	Model-based recognition based on range images	639
12.4	2D view-based representations of a 3D scene	639
12.4.1	Viewing space	639
12.4.2	Multi-view representations and aspect graphs	640
12.4.3	Geons as a 2D view-based structural representation	641
12.4.4	Visualizing 3D real-world scenes using stored collections of 2D views	642
12.5	3D reconstruction from an unorganized set of 2D views—a case study	646
12.6	Summary	650
12.7	References	651
<b>13</b>	<b>Mathematical morphology</b>	<b>657</b>
13.1	Basic morphological concepts	657
13.2	Four morphological principles	659
13.3	Binary dilation and erosion	661
13.3.1	Dilation	661
13.3.2	Erosion	662
13.3.3	Hit-or-miss transformation	665
13.3.4	Opening and closing	665
13.4	Gray-scale dilation and erosion	667
13.4.1	Top surface, umbra, and gray-scale dilation and erosion	667
13.4.2	Umbra homeomorphism theorem, properties of erosion and dilation, opening and closing	670
13.4.3	Top hat transformation	671
13.5	Skeletons and object marking	672
13.5.1	Homotopic transformations	672
13.5.2	Skeleton, maximal ball	673
13.5.3	Thinning, thickening, and homotopic skeleton	675
13.5.4	Quench function, ultimate erosion	677
13.5.5	Ultimate erosion and distance functions	680
13.5.6	Geodesic transformations	681
13.5.7	Morphological reconstruction	682
13.6	Granulometry	684
13.7	Morphological segmentation and watersheds	687
13.7.1	Particles segmentation, marking, and watersheds	687
13.7.2	Binary morphological segmentation	687
13.7.3	Gray-scale segmentation, watersheds	689
13.8	Summary	691
13.9	References	692
<b>14</b>	<b>Image data compression</b>	<b>694</b>
14.1	Image data properties	696
14.2	Discrete image transforms in image data compression	696

14.3	Predictive compression methods	700
14.4	Vector quantization	701
14.5	Hierarchical and progressive compression methods	703
14.6	Comparison of compression methods	704
14.7	Other techniques	705
14.8	Coding	706
14.9	JPEG and MPEG image compression	707
14.9.1	JPEG—still image compression	707
14.9.2	JPEG-2000 compression	708
14.9.3	MPEG—full-motion video compression	711
14.10	Summary	713
14.11	References	715
<b>15</b>	<b>Texture</b>	<b>718</b>
15.1	Statistical texture description	721
15.1.1	Methods based on spatial frequencies	721
15.1.2	Co-occurrence matrices	723
15.1.3	Edge frequency	725
15.1.4	Primitive length (run length)	727
15.1.5	Laws' texture energy measures	728
15.1.6	Fractal texture description	728
15.1.7	Multiscale texture description—wavelet domain approaches	730
15.1.8	Other statistical methods of texture description	734
15.2	Syntactic texture description methods	736
15.2.1	Shape chain grammars	737
15.2.2	Graph grammars	738
15.2.3	Primitive grouping in hierarchical textures	740
15.3	Hybrid texture description methods	741
15.4	Texture recognition method applications	742
15.5	Summary	743
15.6	References	745
<b>16</b>	<b>Motion analysis</b>	<b>750</b>
16.1	Differential motion analysis methods	753
16.2	Optical flow	757
16.2.1	Optical flow computation	757
16.2.2	Global and local optical flow estimation	760
16.2.3	Combined local-global optical flow estimation	762
16.2.4	Optical flow in motion analysis	764
16.3	Analysis based on correspondence of interest points	767
16.3.1	Detection of interest points	768
16.3.2	Correspondence of interest points	768
16.4	Detection of specific motion patterns	771
16.5	Video tracking	775
16.5.1	Background modeling	776
16.5.2	Kernel-based tracking	780
16.5.3	Object path analysis	786

16.6 Motion models to aid tracking	791
16.6.1 Kalman filters	793
16.6.2 Particle filters	798
16.7 Summary	803
16.8 References	805
