INDICE

A. PAOLETTI – Introduzione. Foreword . . . . . pag. xv

Gruppo fotografico dei partecipanti al Corso fuori testo

S. GELLER – Crystal and static magnetic properties of garnets.

I. Mainly structural considerations . . . . . pag. 1
I.1. Introduction . . . . . » 1
I.2. Structure details . . . . . » 1
I.3. Antiferromagnetic garnets . . . . . » 6
I.4. Weakly ferromagnetic garnets . . . . . » 8

II. Rare-earth iron garnets . . . . . » 9
II.1. Introduction . . . . . » 9
II.2. Relation of the three magnetic sublattices . . . . » 14
II.3. Special cases of the rare-earth iron garnets . . . . » 18
II.3'1. Samarium iron garnet . . . . . » 18
II.3'2. Europium iron garnet . . . . . » 19
II.3'3. Erbium iron garnet. . . . . » 19
II.3'4. Thulium iron garnet. . . . . » 21
II.3'5. Ytterbium iron garnet. . . . . » 22
II.4. Neutron diffraction analyses of rare-earth iron garnets » 22
II.5. Some comments on the compensation point . . . . » 23

III. Substituted yttrium iron garnets . . . . . » 24
III.1. Introduction . . . . . » 24
III.2. Specimens . . . . . » 25
III.3. The model for the static magnetic behavior of the diamagnetic-ion-substituted yttrium iron garnets . . » 25
III.3'1. The Néel model. . . . . » 25
III.3'2. The Yafet-Kittel model . . . . . » 27
III.3'3. The Gilleo model . . . . . » 27
III.3'4. The Geller model . . . . . » 28
III.3'5. A semi-empirical mathematical formulation by Dionne . . . . . » 33
III.3'6. Other attempts . . . . . » 34

III.4. Some special topics . . . . . pag. 34
III.4'1. The « particular ion » effect . . . . . » 34
III.4'2. The system $\{Y_{3-x}Ca_x\}Fe_{5-x}Sn_xO_{12}$ . . . . . » 35
III.4'3. The system $\{Y_3\}Fe_{5-x}Al_xO_{12}$ . . . . . » 35
III.4'4. The system $\{Y_3\}Fe_{5-x}Ga_xO_{12}$ . . . . . » 37
III.4'5. Bismuth-substituted yttrium iron garnet . » 38
III.4'6. The system $\{Y_{3-2x}Ca_{2x}\}[Fe_2](Fe_{3-x}V_x)O_{12}$ . . » 39
III.4'7. Yttrium and rare-earth free iron garnets » 41
III.4'8. Paramagnetic-ion substituents . . . . . » 42

IV. Substituted gadolinium iron garnets . . . . . » 43
IV.1. Introduction . . . . . » 43
IV.2. Octahedral substitutions . . . . . » 44
IV.3. Tetrahedral substitution . . . . . » 46
IV.4. The system $\{Gd_3\}[Mg_xFe_{2-x}](Fe_{3-x}Si_x)O_{12}$ . . . . . » 48
IV.5. The $\{Gd_3\}Fe_{5-x}Al_xO_{12}$ system . . . . . » 48
IV.6. A summary of some of the major results on the substituted gadolinium iron garnets. . . . . » 49
IV.7. Practical calculations for low substitutions . . . . » 50

P. HANSEN – Magnetic anisotropy and magnetostriction in garnets.

I. Introduction . . . . . » 56
II. Phenomenological theory. . . . . » 62
1. Free energy . . . . . » 62
1'1. Magnetic anisotropy . . . . . » 62
1'1.1. Cubic anisotropy . . . . . » 62
1'1.2. Uniaxial anisotropy . . . . . » 68
1'2. Magnetoelastic energy (magnetostriction). . . . . » 71
2. Methods of measuring anisotropic properties . . . . . » 79
2'1. Anisotropy constants. . . . . » 79
2'2. Magnetostriction constants . . . . . » 82

III. Micromagnetic theory . . . . . » 83
3. Origin of magnetically anisotropic phenomena . . . . » 83
4. Temperature dependence of the anisotropy constants » 85
5. Temperature dependence of the magnetostriction constants. . . . . » 91

IV. Quantum-mechanical theory . . . . . » 98
6. Spin Hamiltonians . . . . . » 98
7. Energy levels . . . . . » 103

8. Magnetic anisotropy . . . . . pag. 108
8·1. Anisotropy constants at $T = 0$ K . . . . . » 108
8·2. Temperature dependence of the anisotropy constants » 114
9. Magnetostriction constants . . . . . » 119
10. Induced anisotropies . . . . . » 124

V. Uniaxial anisotropies . . . . . » 125
11. Models . . . . . » 125
12. Europium-based iron garnets . . . . . » 127

J. C. SLONCZEWSKI and A. P. MALOZEMOFF – Physics of domain walls in magnetic garnet films.

1. Introduction . . . . . » 134
2. Domain patterns in films . . . . . » 136
2·1. Magnetic energy . . . . . » 136
2·2. Bloch wall. . . . . » 136
2·3. Domain patterns . . . . . » 137
2·4. Transitions between domain patterns. . . . . » 139
2·5. Isolated bubbles . . . . . » 141
3. Statics of Bloch lines . . . . . » 142
3·1. Local wall energy . . . . . » 143
3·2. Bloch lines . . . . . » 144
3·3. Interactions between Bloch lines. . . . . » 147
3·4. Hard bubbles . . . . . » 148
4. Dynamics of the wall surface . . . . . » 149
4·1. General relations . . . . . » 149
4·1.1. Equations of wall motion. . . . . » 149
4·1.2. General approximations. . . . . » 151
4·1.3. Conservation of energy and velocity bounds . . » 151
4·2. Motion in one dimension . . . . . » 152
4·2.1. Constant velocity . . . . . » 152
4·2.2. Oscillatory motion . . . . . » 153
4·3. Wall waves . . . . . » 154
4·4. Hard walls . . . . . » 156
5. Bloch points . . . . . » 158
5·1. Singular neighborhood . . . . . » 158
5·2. Structure and energy. . . . . » 159
5·3. External fields . . . . . » 161
5·4. Gyrovector . . . . . » 162
6. Deflection effect . . . . . » 164
6·1. Equation of bubble motion . . . . . » 164
6·2. Steady-state deflection . . . . . » 168
6·3. Quantization. . . . . » 169

7. Bloch-line dynamics . . . . . pag. 172
7·1. Velocity-force relation . . . . . » 172
7·2. Periodic array . . . . . » 174
7·3. Clustered Bloch lines . . . . . » 175
7·4. Horizontal Bloch line . . . . . » 176
7·5. Nucleation and breakdown . . . . . » 178
7·6. State transitions . . . . . » 180
7·7. Saturation velocity . . . . . » 181
7·8. In-plane field . . . . . » 182
8. Bubble translation . . . . . » 184
8·1. Steady-state structure . . . . . » 184
8·2. Bloch-line momentum . . . . . » 187
8·3. Overshoot theory . . . . . » 189
8·4. Experiments . . . . . » 192

P. E. WIGEN – Magnetic excitations . . . . . » 196

1. The exchange Hamiltonian and spin waves . . . . . » 197
1·1. Heisenberg exchange Hamiltonian . . . . . » 197
1·2. The Weiss molecular field . . . . . » 199
1·3. Spin waves . . . . . » 199
1·3.1. Linear chain with periodic boundary conditions and $S = \frac{1}{2}$ . . . . . » 200
1·3.2. Three dimensions and arbitrary S . . . . . » 201
1·3.3. Linear chain with $S = \frac{1}{2}$ and end spins pinned » 202
1·4. Additional spin interactions in the Hamiltonian. . . . » 203
1·4.1. Single-ion anisotropy . . . . . » 203
1·4.2. Terms coupling spin pairs . . . . . » 204
1·4.3. Biquadratic terms . . . . . » 204
2. Holstein-Primakoff transformations . . . . . » 205
2·1. Introduction of Bose operators . . . . . » 206
2·2. Transformation to spin waves . . . . . » 207
2·3. Diagonalization transformation . . . . . » 208
3. Spin waves in the garnet multi-sublattice model. . . . . » 212
4. Surface inhomogeneity model and surface spin waves . . . » 214
4·1. Surface inhomogeneity model . . . . . » 215
4·1.1. Diagonalizing transformation . . . . . » 216
4·1.2. The dispersion relation and the transformation functions $u_i(\tau)$ . . . . . » 219
4·1.3. The characteristic equation . . . . . » 220
4·1.4. Angle dependence of the surface parameter. . . » 222
4·1.5. Additional surface anisotropy terms . . . . . » 222
4·2. Experimental results . . . . . » 224
4·3. Microscopic model for the surface inhomogeneity model » 232
5. Spin waves in the continuum model . . . . . » 233
5·1. Equations of motion . . . . . » 233

5·2. Boundary condition . . . . . pag. 238
5·2.1. Unidirectional surface anisotropy . . . . . » 240
5·2.2. Uniaxial surface anisotropy . . . . . » 241
5·3. Characteristic energy densities in the bulk regions . . » 243
6. Volume inhomogeneity model . . . . . » 245
7. Nonparallel ground state . . . . . » 253
8. Spin wave scattering in a magnetic-domain wall. . . . . » 259

R. W. TEALE – Magnetic-relaxation phenomena.

1. Phenomenological description . . . . . » 270
1·1. Magnetizing processes and the equation of motion . . » 270
1·2. Uniform motion of the magnetization, ferromagnetic resonance . . . . . » 271
1·3. Magnetic-domain wall motion . . . . . » 274
2. Spin waves. . . . . » 276
3. Relaxation in pure yttrium iron garnet crystals . . . . . » 278
3·1. The perfection of YIG . . . . . » 278
3·2. Line width of ferromagnetic resonance . . . . . » 279
3·3. The parallel-pump experiment. . . . . » 280
3·4. Modulated-resonance experiments . . . . . » 283
3·5. Policrystalline samples . . . . . » 284
3·6. Nonlinear effects . . . . . » 286
3·7. Magnetic-domain wall motion . . . . . » 288
4. Ferromagnetic resonance in rare-earth iron garnets . . . . » 290
5. Relaxation in rare-earth-doped YIG . . . . . » 291
5·1. Ferromagnetic resonance . . . . . » 292
5·1.1. The longitudinal-relaxation model . . . . . » 293
5·1.2. Comparison with experiment . . . . . » 297
5·2. Domain wall motion . . . . . » 302
5·2.1. The longitudinal-relaxation model . . . . . » 302
5·2.2. Comparison with experiment . . . . . » 303
5·2.3. The correlation of wall mobility and resonance line width. . . . . » 306
6. Ferrous-iron impurities . . . . . » 308
6·1. Ferromagnetic resonance and magnetic anneal . . . . » 308
6·2. Domain wall motion . . . . . » 315
6·3. Summary of the phenomenological discussion . . . . . » 316
7. Some other dopants. . . . . » 317

A. TUCCIARONE – Photoinduced phenomena in garnets.

1. Observations of photomagnetic phenomena . . . . . » 320
1·1. Introduction . . . . . » 320
1·2. Photoinduced effects with change of symmetry (photo-induced anisotropy effects) . . . . . » 321

1·3. Photoinduced effects without change of symmetry . . pag. 324
1·4. Optical photoinduced effects. . . . . » 327
2. Symmetry properties of photomagnetic sites. . . . . » 331
Octahedral sites . . . . . » 331
Tetrahedral sites . . . . . » 333
Dodecahedral sites . . . . . » 335
3. Theoretical analysis of photoinduction processes . . . . . » 338
3·1. The rate equation . . . . . » 338
3·2. The axial model . . . . . » 342
3·2.1. Linearly polarized light in a magnetic field. . . » 342
3·2.2. The general axial-model absorption . . . . . » 343
3·2.3. Photoinduced linear dichroism. . . . . » 344
3·2.4. Photoinduced magnetocrystalline torque . . . . » 345
3·3. The perturbative axial model . . . . . » 347
3·4. Microscopic theory . . . . . » 351
4. Nonphotoinduced absorption properties of photomagnetic centres. . . . . » 352
4·1. The dichroism from magnetoinduced population imbalance . . . . . » 352
4·2. « First-order » circular dichroism (1st order CD) . . . . » 355
4·3. Vacancies in Si-doped YIG: investigation by means of 1st order CD . . . . . » 359

U. Enz – Irreversible photomagnetic effects in garnets.

1. Introduction . . . . . » 364
2. Underlying mechanism . . . . . » 365
3. Experimental results . . . . . » 366
3·1. Light-induced permeability changes . . . . . » 366
3·2. Coercive force and switching properties . . . . . » 370
3·3. Spectral dependence and light-induced change of absorption constant . . . . . » 372
4. Discussion . . . . . » 375

J. F. Dillon jr. – Magneto-optical properties of magnetic garnets.

1. Phenomenology of magneto-optical properties . . . . . » 379
1·1. Introduction . . . . . » 379
1·2. Polarized light and the Poincaré sphere . . . . . » 379
1·3. Propagation in magnetic media . . . . . » 382
1·4. Transmission effects . . . . . » 384
1·5. Reflection effects . . . . . » 387
1·6. Rotation and dielectric tensor . . . . . » 388
1·7. Paramagnetic and diamagnetic ε_{12} . . . . . » 390
1·8. Photoinduced effects . . . . . » 391

2. Magneto-optical rotation . . . . . pag. 392
2'1. Introduction . . . . . » 392
2'2. Energy levels . . . . . » 392
2'3. Overall absorption spectrum of YIG . . . . . » 393
2'4. Overall rotation spectrum of YIG . . . . . » 394
2'5. Broad view . . . . . » 395
2'6. Temperature . . . . . » 395
2'7. Lattice constant . . . . . » 396
2'8. Rare-rarth substitution . . . . . » 399
2'9. Bismuth substitution . . . . . » 400
2'10. Nature of the transitions . . . . . » 402
2'11. Kerr effect in BiYIG . . . . . » 402
2'12. Variation of rotation with temperature . . . . . » 402
2'13. Variation of rotation with field . . . . . » 407
2'14. Experimental technique . . . . . » 409
3. Linear magnetic birefringence . . . . . » 411
4. Conclusion . . . . . » 415

R. METSELAAR and P. K. LARSEN – Electrical properties of yttrium iron garnet.

1. Introduction . . . . . » 417
2. Theory . . . . . » 419
2'1. D.c. conductivity, Seebeck effect and Hall effect . . . » 419
2'2. Large and small polarons . . . . . » 420
2'3. Dielectric-relaxation losses . . . . . » 421
2'4. Extrinsic and intrinsic conductivity range . . . . . » 422
2'5. Impurity and inhomogeneous conduction . . . . . » 424
3. Low-temperature results . . . . . » 425
3'1. D.c. measurements . . . . . » 425
3'2. Dielectric properties . . . . . » 428
3 3. Inhomogeneous conduction . . . . . » 430
4. High-temperature results . . . . . » 433
4'1. Oxygen vacancies in YIG . . . . . » 435
4'2. Intrinsic conductivity range . . . . . » 435
4'3. Extrinsic conductivity range . . . . . » 438
5. Impurities in YIG . . . . . » 441
6. Conclusions . . . . . » 442

G. B. SCOTT – The optical absorption and magneto-optic spectra of $Y_3Fe_5O_{12}$.

1. Introduction . . . . . » 445
2. Phenomenology of the dielectric tensor . . . . . » 446

3. Absorption spectrum . . . . . pag. 449
3·1. Region *a*) . . . . . » 449
3·2. Region *b*) . . . . . » 453
3·3. Region *c*) . . . . . » 456
4. Magneto-optic spectrum . . . . . » 460

Cz. RUDOWICZ – Spin Hamiltonian and magnetic anisotropy. Application to $3d^4$ and $3d^6$ ions.

I. Spectroscopic part . . . . . » 467
1. Paramagnetic ion in crystal field . . . . . » 467
2. Conventional spin Hamiltonian . . . . . » 468
3. $3d^4$ and $3d^6$ ions. . . . . » 469
4. Derivation of spin Hamiltonian by tensor method . . . » 470
5. Results for $3d^4$ and $3d^6$ ions . . . . . » 471

II. Magnetic part . . . . . » 472
1. Single-ion model of magnetic anisotropy . . . . . » 472
2. Theory of spin $S=2$ . . . . . » 473
3. Numerical results . . . . . » 474
4. Problem of Fe^{2+} in Si(Ge):YIG . . . . . » 475

W. JANTZ, W. WETTLING and J. SCHNEIDER – Investigation of spin waves in YIG and $FeBO_3$.

1. Introduction . . . . . » 478
2. Spin waves in YIG studied by nonlinear spectroscopy . . . » 479
2·1. Some basic properties of spin wave instabilities. . . . » 479
2·2. Fine structure . . . . . » 482
2·3. Fold-over effects . . . . . » 486
2·4. Anisotropy . . . . . » 488
2·5. Magnetoelastic interaction. . . . . » 490
3. Spin waves in $FeBO_3$ studied by Brillouin scattering . . . » 494
3·1. Basic features of Brillouin scattering from thermal magnons . . . . . » 494
3·2. $FeBO_3$—a weak ferromagnet. . . . . » 496
3·3. Results on spin wave dispersion. . . . . » 497
4. Summary and outlook . . . . . » 501

R. KRISHNAN – Investigation of site distribution and valence states of some cations in garnet compounds. . . . . » 504

1. Magnetization methods . . . . . » 507
2. Magnetic anisotropy. . . . . » 507
3. Optical methods . . . . . » 509

4. Mössbauer spectroscopy . . . . . pag. 510
5. Spin echo technique . . . . . » 510
Diamagnetic cations. . . . . » 511
Paramagnetic cations . . . . . » 511
YIG:Mn . . . . . » 512
Mn^{2+} . . . . . » 512
$Mn^{4+}(d^3)$ . . . . . » 513
Mn^{3+} . . . . . » 513
YIG:Co. . . . . » 515

W. Tolksdorf – Preparation and imperfections of magnetic materials with garnet structure.

Introduction. . . . . » 521
1. Polycrystalline materials. . . . . » 524
2. Single crystals . . . . . » 526
3. Epitaxial layers. . . . . » 536
4. Conclusions. . . . . » 539
