PREFACE	V
CHAPTER 1: THE RELEVANT MATERIAL ON SINGLE STOCKING POINT INVENTORY THEORY	1
INTRODUCTION	3
1.1. A short history	4
1.2. Basic elements in inventory control: demand, replenishment, cost	6
1.2.1. <i>Demand</i>	6
1.2.2. <i>Replenishment</i>	7
1.2.3. <i>Inventory costs</i>	11
1.3. Classification of items	12
1.4. Classification of inventory control models	14
1.5. Demand forecasting	17
1.5.1. <i>Forecasts using histories of observed demands</i>	18
1.5.2. <i>Forecasts based on reliability analysis</i>	20
1.5.3. <i>Combined forecasting techniques</i>	22
1.6. Optimization: deterministic models	25
1.6.1. <i>A simple, continuous dynamic model</i>	25
1.6.2. <i>Time discrete multiperiod inventory system</i>	27
1.6.3. <i>Nonstationary demand occurring continuously in time</i>	30
1.7. Optimization: stochastic models	30
1.7.1. <i>A simple single period model with stochastic demand</i>	31
1.7.2. <i>Extension to multiperiod and infinite horizon cases</i>	34
1.7.3. <i>Stochastic demand and nonzero lead time</i>	36

CHAPTER 2: INTRODUCTION TO MULTIPLE-STOCKING- POINTS INVENTORY THEORY	49
INTRODUCTION	51
2.1. Roots	52
2.2. Literature review	59
2.3. The terms: multilevel, multiechelon, multistrata, multilayer, multiindenture, multistate	67
2.3.1. <i>Echelons</i>	68
2.3.2. <i>Strata</i>	70
2.3.3. <i>Layers</i>	71
2.3.4. <i>Indenture levels</i>	73
2.3.5. <i>Multistate end-products</i>	75
2.4. Multilevel structure	77
2.4.1. <i>Inventories with consumables</i>	78
2.4.2. <i>Inventories with repairables</i>	83
2.5. Demand and repair processes	86
2.5.1. <i>Basic assumptions about demand</i>	87
2.5.2. <i>Multiechelon demand specifics</i>	88
2.5.3. <i>Demand forecasting</i>	90
2.5.4. <i>Repair times</i>	93
2.6. Ordering policies and control procedures	95
2.6.1. <i>Multilevel aspects</i>	96
2.6.2. <i>Uniform versus diverse policies in the system</i>	97
2.6.3. <i>The most frequently used ordering policies</i>	98
2.7. Parameters	101
2.7.1. <i>Item parameters</i>	102
2.7.2. <i>Subinventory parameters</i>	103
2.7.3. <i>Parameters of inventory system as a whole</i>	105
2.7.4. <i>Environmental parameters</i>	105
2.8. Measures of performance in system design and control	107
2.8.1. <i>Measures of performance in system design</i>	108
2.8.2. <i>Measures of performance in inventory control</i>	113
REFERENCES	118

CHAPTER 3: STATIONARY ANALYSIS	123
INTRODUCTION	125
3.1. Two-level systems with (S-1,S) policies	127
3.1.1. <i>Performance measures for a two-echelon system</i>	128
3.1.2. <i>METRIC, MOD-METRIC and Real-time METRIC models</i>	140
3.1.3. <i>Two-echelon systems with emergency resupply possibilities</i>	148
3.1.4. <i>A simple two-station serial system</i>	154
3.2. Several models for multilevel systems	162
3.2.1. <i>Extension of METRIC model to a three-echelon system</i>	163
3.2.2. <i>A model for a multitem, multilocation, multi-repair type inventory and maintenance system</i>	166
3.2.3. <i>A model for a multiechelon inventory system with emergency resupply possibilities</i>	169
3.3. A two-level system with (S-1,S) policies at bases and (s,S) policy at depot	174
3.4. Multiechelon inventory systems with policies other than (S-1,S)	184
3.4.1. <i>Demand processes at the higher echelon</i>	185
3.4.2. <i>Probability distribution of inventory position in two-echelon system</i>	192
3.4.3. <i>Service level performances</i>	195
REFERENCES	203
CHAPTER 4: OPTIMIZATION TECHNIQUES	209
INTRODUCTION	211
4.1. Method of Lagrange multipliers	212
4.1.1. <i>Theoretical background</i>	212
4.1.2. <i>Optimization of stock levels in a two-level spare parts inventory system: problem statement</i>	215
4.1.3. <i>Fox-Landi procedure</i>	217
4.1.4. <i>The bisection method</i>	227
4.1.5. <i>Muckstadt's approximation methods</i>	232
4.2. Dynamic programming approach	237

	Page
4.2.1. <i>General formulation of the allocation process</i>	237
4.2.2. <i>Optimization of allocation processes</i>	238
4.2.3. <i>Dynamic programming applied to optimal spares allocation in a two-level inventory system</i>	245
4.2.4. <i>Approximations in the use of dynamic programming</i>	253
4.3. Incremental reliability per pound algorithms	261
4.3.1. <i>Theoretical preliminaries</i>	261
4.3.2. <i>Incremental per pound procedure in two-level inventory optimization</i>	264
4.3.3. <i>An application of incremental per pound algorithm - Reprise</i>	271
4.4. Satisfying stock levels - analytical approach	276
4.4.1. <i>Satisfaction versus optimization</i>	276
4.4.2. <i>Satisfactory stock levels in two-level systems</i>	277
