CONTENTS

1. DYNAMICS AND THERMODYNAMICS OF SYSTEMS OF INTERACTING SPINS	1
A. Epitome of the theory of spin temperature	2
(a) The Hamiltonian	2
(b) The concept of spin temperature	4
1. Low fields	5
2. High fields	6
3. High fields in the presence of r.f.	7
(c) NMR signals and Provotorov equations	9
1. Free precession signal	9
2. Absorption and dispersion at low r.f. level	10
3. The Provotorov equations	12
B. The Liouville formalism and memory functions	15
(a) Definition	15
(b) 'Operators of interest' and memory functions	17
(c) The generalized Provotorov equations: an illustration of the Liouville formalism	19
1. Long term trend toward thermal equilibrium	19
2. Short term transient oscillations	22
(d) Resonance line shape and memory functions	25
1. Introduction of the memory function	25
2. Gaussian approximation for the memory function	28
(e) An illustration: Coupling between unlike spin systems	32
1. The basic equations	33
2. The experimental sequence	36
3. Analysis of the experimental results	38
C. On the validity of the concept of spin temperature	41
(a) The random phase assumption	41
(b) The trend toward spin temperature: Production and observation of dipolar order in high field	43
(c) Phase refocussing. The magic sandwich	45
1. The argument for irreversibility	45
2. The magic sandwich	47
D. Spin-lattice relaxation	49
2. COHERENT MANIPULATION OF NUCLEAR SPINS AND HIGH RESOLUTION IN SOLIDS	53
A. The spin Hamiltonians	54

(a) The quadrupole interaction	55
(b) The chemical shift	56
(c) The indirect couplings	56
B. Fast rotation of the sample	57
C. Homonuclear narrowing through spin manipulation	58
(a) Large effective field in the rotating frame	58
(b) Multipulse methods	64
1. An illustrative example	64
2. α The effective periodic Hamiltonian	66
β The Magnus expansion	69
3. Two efficient multipulse cycles	73
α The WHH-4 sequence	73
β The MREV sequence	75
4. Off-resonance irradiation and second averaging	76
5. Pulses of finite width	77
6. Limitations due to pulse imperfections	82
D. Heteronuclear narrowing for spins of rare isotopes	84
(a) Measurement of chemical shifts	86
(b) Measurement of dipolar interactions	89
E. An illustrative example of heteronuclear spin manipulation	93
F. Multipulses and spin temperature: two experiments	95
G. The Magnus paradox	103
3. NUCLEAR MAGNETIC RESONANCE OF SOLID ^3He	108
A. Introduction	108
B. The various 'motions' in solid ^3He	112
(a) Exchange	112
1. The exchange Hamiltonian	112
2. The exchange integral	114
(b) Vacancies	117
1. The formation energy	117
2. The tunnelling frequency	118
3. Vacancy waves	120
(c) Impurities of ^4He	121
(d) Phonons	122
C. The effects of exchange on NMR in solid ^3He	122
(a) The theory of the spin-lattice relaxation T_{1c}	123
(b) The theory of line width and transverse relaxation time	127
1. Adiabatic linewidth	127
2. Transverse relaxation: general theory	132
(c) Exchange and diffusion of nuclear magnetization	134
(d) NMR and exchange: experimental results	138
D. The effects of vacancies on NMR in solid ^3He	144

(a) Introduction	144
(b) Vacancies and diffusion of nuclear magnetization	146
(c) Theory of the relaxation and narrowing by vacancies	147
(d) Diffusion and Zeeman relaxation caused by vacancies: experimental results	153
1. Diffusion	153
2. Zeeman-vacancies relaxation	154
E. Non-Zeeman relaxation mechanisms	156
(a) Exchange-defects coupling	156
1. Exchange-vacancies coupling	156
2. Exchange-impurities coupling	159
(b) Defects-phonons coupling	161
1. Relaxation	161
2. Vacancy waves and phonons	164
F. Multiple echoes in solid ^3He	166
(a) Simplified theory of multiple echoes	167
(b) General case	172
1. The effects of relaxation	172
2. Sample shape and field gradient	173
3. The effects of diffusion	174
(c) Experimental results	175
G. Low temperature properties of solid ^3He	180
(a) Inadequacy of the Heisenberg Hamiltonian in the paramag- netic state	180
(b) Physical origin of multiple-spin exchange	182
4. NUCLEAR MAGNETISM OF SUPERFLUID ^3He	186
A. Introduction: The new phases of liquid ^3He	186
B. Normal ^3He and the Landau interactions	188
(a) Molecular fields	190
(b) Free energy of a Landau fluid	191
(c) Static magnetic susceptibility	192
(d) Some numerical data on liquid ^3He	193
C. The Cooper pairs and the BCS theory applied to ^3He	193
D. The order parameter	195
E. Elementary excitations and energy gap in superfluid ^3He	200
(a) Linearization of the interaction Hamiltonian	200
(b) Diagonalization of the energy matrix	202
(c) The self-consistent equation	204
F. Solutions of the BCS equations and the Ginzburg-Landau approximation	206
(a) The critical temperature	206
(b) Solutions below the critical temperature	208

(c)	The free energy and the Ginzburg–Landau approximation	210
(d)	The $l = 1$ solutions of the BCS equation: the ABM and BW phases	212
G.	Magnetic susceptibility	214
(a)	Susceptibility of a single pair $d(n)$	214
(b)	Susceptibility of a superfluid phase	220
(c)	Landau corrections to the susceptibility	221
(d)	Experimental results	222
(e)	The adiabatic susceptibility	223
H.	The magnetic dipole–dipole interactions in superfluid ^3He	226
(a)	The local field	226
(b)	The dipolar interactions in superfluid ^3He	227
(c)	Estimate of the constant g_D	229
I.	Magnetic resonance: The various energies, the commutation relations, the equations of motion	232
(a)	Magnetic and dipolar energy: equilibrium states	232
(b)	The adiabatic approximation	234
(c)	The commutation relations	236
(d)	The equations of motion	238
J.	Magnetic resonance in the ABM and BW phases	240
(a)	Equations of motion	240
1.	The ABM phase	240
2.	The BW phase	240
(b)	Motions of small amplitude	242
1.	The ABM phase	242
2.	The BW phase	243
(c)	Experimental results	244
(d)	Motions of large amplitude	247
1.	Longitudinal ringing in the ABM phase	247
2.	Free precession in the ABM phase	248
3.	Free precession in the BW phase	251
(e)	Experimental results	254
K.	Walls	255
(a)	General	255
(b)	Nuclear magnetism of the BW phase in restricted geometry	258
(c)	The wall-pinned mode	261
L.	Relaxation	263
(a)	The theory	263
1.	Superfluid and normal magnetizations	263
2.	The equations of motion	266
3.	Relaxation of energy	268
(b)	Relaxation of the wall-pinned mode	268
(c)	Relaxation of oscillations of small amplitude	269

5. SPIN SYSTEMS AT LOW TEMPERATURE	273
A. Formal expression of the resonance signal	274
B. The Zeeman resonance signal	276
(a) The moments of the absorption signal	279
(b) The first moment	281
1. One spin species	281
2. Several spin species	285
(c) The second moment	288
(d) Higher moments	291
C. Rigorous NMR results	293
(a) Area of the absorption signal	293
(b) Rate of change of the polarization	293
(c) Slightly saturating linear passages	294
1. Saturation of the polarization	294
2. Saturation of the dipolar energy	295
(d) First moment of the absorption signal	299
(e) Qualitative shape of the absorption signal	301
(f) Linear response and transverse spin susceptibility	302
(g) Cotanh transform of the absorption signal. Measurement of the dipolar temperature	306
D. Non-linear effects in spin temperature	313
(a) The diagrammatic method	315
1. The longitudinal case	316
α The semi-invariants	317
β Contractions and diagrams	318
2. The general case	322
(b) Thermodynamic properties of the spin system	327
1. Dipole-dipole energy	328
2. Spin polarization	329
3. Free energy	330
4. Entropy	331
5. Transverse susceptibility	332
(c) Experimental illustration	332
1. Variation of dipolar energy with polarization in high effective field	332
2. Susceptibilities in zero effective field	336
6. THERMAL CONTACT BETWEEN NUCLEAR SPINS AND PARAMAGNETIC IMPURITIES: NUCLEAR RELAXATION AND DYNAMIC POLARIZATION	339
Introduction	339
A. Structure and relaxation of paramagnetic centres	341
(a) Spin Hamiltonian and hyperfine structure	342

(b) Electronic spin–lattice relaxation: spins and phonons	344
1. Pure electronic relaxation	344
2. Nuclear hyperfine relaxation	346
B. Nuclear relaxation by isolated paramagnetic impurities	349
(a) An isolated electron–nucleus pair	349
1. The random field approach	349
2. The scrambled states approach	351
(b) The relaxation of an assembly of nuclear spins by non-interacting paramagnetic centres	354
C. The well-resolved solid effect	355
(a) The rate equations	355
(b) Experimental results	359
D. Electronic spin–spin interactions and electronic spin–spin temperature	362
E. Electronic spin–spin reservoir and nuclear relaxation	365
(a) The coupling between the nuclear Zeeman and the electronic non-Zeeman reservoirs	365
(b) Nuclear Zeeman relaxation	368
(c) Nuclear dipolar relaxation	371
F. Electronic spin–spin reservoir and nuclear dynamic polarization	373
(a) Historical background	373
(b) High temperature case	377
(c) Low temperature case	379
1. Inhomogeneous broadening of the first type	379
2. Inhomogeneous broadening of the second type	383
(d) Numerical results	388
(e) Experimental results	393
G. Applications of DNP	402
(a) The Nedor method	402
(b) Polarized targets for nuclear and particle physics	405
H. Other examples of coupling between the electronic spin–spin reservoir and the nuclear Zeeman reservoir	408
(a) The rotating crystal	408
(b) The bootstrap effect: cooling of electron spins by nuclei in low fields	411
1. The triplet	411
2. The singlet	415
(c) Cooling of a gas by laser irradiation: an analogue of DNP	417
7. NUCLEAR MAGNETISM AND NEUTRONS: NUCLEAR PSEUDOMAGNETISM	419
A. Slow neutron scattering by an isolated nucleus	420
(a) Scattering on a spinless nucleus	420

(b) Slow neutron scattering by a nucleus with a spin I	424
B. Slow neutron scattering by a macroscopic target: Bragg scattering	426
(a) Spinless nuclei	427
(b) Nuclei with spin	430
C. Pseudomagnetic nuclear field and pseudomagnetic resonance	433
(a) A simple scheme	434
(b) Rotating pseudomagnetic field	435
(c) Experimental procedure and results	436
(d) Methodological digressions	438
D. Systematic measurements of nuclear pseudomagnetic moments	440
(a) Bragg scattering on polarized targets	441
(b) Pseudomagnetic precession and the two-coils method	443
1. The principle	443
2. The results	447
3. Fall-out for nuclear magnetism	450
E. Wave-like description of the neutron	452
(a) Refractive index	452
(b) Transmission and absorption	453
(c) Pseudomagnetic precession	456
F. Neutron scattering and spatial correlations between nuclear spins; domain size	459
(a) The correlation function	459
(b) Mapping of the correlation function and domain size	462
(c) Short-range spin correlations in a paramagnetic dipolar state	466
8. NUCLEAR DIPOLAR MAGNETIC ORDERING	470
A. Introduction	470
(a) Production of nuclear magnetic ordering: the principle	470
(b) General features of nuclear magnetic ordering	473
B. Prediction of the ordered structures	476
(a) The method of Villain	477
1. General form of the solutions	480
2. Systems with two spin species	483
(b) The method of Luttinger and Tisza	485
(c) The stable structures in CaF_2	487
(d) The stable structures in LiF and LiH	493
(e) The stable structures in Ca(OH)_2	495
(f) General character of the nuclear ordered structures	498
C. Approximate theories of ordering	500
(a) The Weiss-field approximation	500
1. The Weiss-field equations	500
2. Weiss-field and spin temperature	503
(b) The restricted-trace approximation	505

D. Antiferromagnetism in zero field	510
(a) Transverse susceptibility	511
1. Calcium fluoride	511
2. Lithium fluoride and hydride	516
(b) Longitudinal susceptibility	520
(c) Non-uniform longitudinal susceptibility of the ^{19}F spins in CaF_2	524
1. Quadrupole alignment of the rare spins	529
(d) Spin-lattice relaxation	531
1. Short correlation time: $\tau_c \ll T_2$	532
2. Long correlation time: $\tau_c \gg T_2$	533
(e) Neutron diffraction in lithium hydride	535
E. Ferromagnetism	539
(a) Characteristic properties of ferromagnets with domains	539
(b) Resonance of ^{43}Ca in ferromagnetic CaF_2	545
1. Evidence for the production of ferromagnetism	545
2. Dipolar field as a function of energy	549
(c) Ferromagnetic-antiferromagnetic transition in CaF_2	551
(d) Transverse susceptibilities	553
1. Ferromagnetic calcium fluoride	554
2. $\text{Ca}(\text{OH})_2$ at negative temperature	555
3. $\text{Ca}(\text{OH})_2$ at positive temperature	556
(e) Neutron diffraction in LiH	558
F. Antiferromagnetism in non-zero field	560
(a) Second order transition	561
(b) The mixed state	564
1. Qualitative discussion	564
2. Quantitative description	566
(c) Experimental results	570
(d) Comparison with other antiferromagnetic systems	571
G. Investigation of the ordered domains	575
(a) An estimate of the thickness of ferromagnetic domains	576
(b) Neutron diffraction and domains in LiH	577
(c) NMR investigation of ferromagnetic domains in CaF_2	580
1. Reproducibility of the domains	580
2. Thickness of the domains	583
(d) Control of paramagnetic impurities	587
H. Some further aspects of the theory of nuclear antiferromagnetism	589
(a) The spin wave approximation	589
1. Elementary excitations	590
2. Sublattice polarization	591
3. Energy	594
(b) The random phase approximation (RPA)	596
