Part One Microeconomics of Invention, Innovation, and Diffusion

1 Preliminary concepts and relations 3
Production processes, techniques, and technology 4
Efficient techniques and technological progress 6
Allocative efficiency, X-efficiency, and relative rationality 8
Invention, innovation, and the role of science 11
Product and process innovations 13
Dynamic economies of scale, product cycle, and innovation 15
The trigger effect and an illustration of the long-term effects on prices 17
Economic growth and aggregate measures of innovation 19

2 Inventive activity: distinct characteristics of nature and size 25
Public good quality of invention and game aspects of the invention/innovation process 25
Surges of basic inventions, innovative potentials, and variations in innovation rates 29

3 Major time trends and cross-sectional tendencies: stylized facts 34
Major time trends 34
Major cross-sectional characteristics 38
The dominant innovation stimulus: technology-push versus demand-pull hypothesis 44
The interfirm variation in R&D expenditure: Mansfield's model 45

4 Market structure, rivalry, and innovation 48
Market structure, R&D expenditure, and innovation: the Nordhaus model 50
Innovation, demand, and market structure: the Dasgupta–Stiglitz model 57
Process versus product innovation: the optimal mix under free entry 61
Oligopolistic (with free entry) versus socially managed industry when the spillover effect is present 62
A note on strategic innovation 64

5 Behavioural and evolutionary versus neoclassical theory of technical choice and innovation 65
Key principles of the neoclassical theory of technical choice 65
The choice of techniques under perfect competition in an n-sector economy 66
Criticisms of the neoclassical theory 68
Natural selection and the evolutionary thesis 70
The 'behavioural approach' 71
The Nelson–Winter 'evolutionary' model of technical choice and innovation 72

6 Innovation diffusion: theory and evidence 79
Two key stylized facts of innovation diffusion 80
Mathematical theory of spread of information and the logistic curve 81
The Mansfield model 83
The Davies model 85
Some empirical findings 89
The game-theoretic approach: a model by Grindley 91

7 The behaviour of enterprises and innovation characteristics in centrally managed economies 94
The paradox of a high inefficiency and (until the late 1970s) respectable innovation rate 94
The discipline of the plan and the freedom of the firm 98
Systemic characteristics and policy aspects of innovation in centrally managed economies 106
The effects of Hungarian-type reforms 112

Part Two Macroeconomics of Innovation, Technology Transfer, and Growth

8 Innovation biases, factor substitution, and the measurement of technological change: definitions and theory 117
Innovation biases: two-factor and n-factor analysis 118
The Diamond–McFadden–Rodrigues non-identification theorem 127
Technological bias and the question of balanced growth 128
The measurement of productivity change and its contribution to growth: a disaggregated analysis and aggregation rules 132
Optimal bias and Harrod neutrality: innovation possibility frontier versus localized search 142
The n-sector case 148

9 Variation of innovation rates among countries and over time: the First Hat-Shape Relationship 149
Stylized facts of macroeconomic history in the course of global industrialization 149
Catching-up and the First Hat-Shape Relationship: a preliminary interpretation 159
Catching-up by the OECD and CMEA countries 161

10 'Technological revolution' as an innovation superwave in the world technological frontier area 169
The Phelps model of innovation and balanced growth 170
Human inventive and innovative heterogeneity and technological progress in the technology sector itself: two generalizations 173
Price's two laws and 'technological revolution': the case of unbalanced growth 176
A consistency test of the model and Lotka's law 180
The Second Hat-Shape Relationship and the hypothesis of innovation limits to growth 182
The plausibility of the innovation slow-down hypothesis 188
Conclusions 191

11 Evidence and microeconomics of the international technology transfer 192
International distribution of R&D activity and new patents 192
Channels, costs, benefits, and the role of local R&D activity 196
The Krugman model and its extensions 199
Licensing, joint ventures, and foreign direct investment 202

12 Macrotheories and evidence of international technology transfer 207
Transfer costs and 'appropriate technology' 207
A model of innovation and growth involving technology transfer 210
The Findley model 214
Technological duality and the catching-up 216
Import-led growth as a policy 220

13 Innovation rate and change of economic systems: a grand scenario 223
Major historical trends: a summary 223
A global industrialization phenomenon and the transition from pre- to post-industrial society 227
Rapid innovation epoch and the capitalization of feudalism and socialism 228
The innovation limits to growth and the survival of capitalism 230
