PREFACE	i-ii
CONTENTS	iii-viii

PART I : QUANTUM STATISTICAL MECHANICS

CHAPTER 1

THE LIOUVILLE EQUATION IN CLASSICAL MECHANICS

1.1 Introduction: Classical and Quantum Mechanics in the Statistical Context	1
1.2 The Classical Statistical Scheme	
1.2.1 Transformation operator G	4
1.2.2 Probability distribution density \mathcal{D}	5
1.2.3 The Liouville Theorem	7
1.2.4 Time dependent density \mathcal{D}_{t,t_0}	10
1.3 Quantum Analogy	11
1.4 Symmetry Properties	14
1.5 Time-Independent Hamiltonians	16
1.6 Example	18
1.7 Property of Reversibility	19

CHAPTER 2

THE LIOUVILLE EQUATION IN QUANTUM MECHANICS

2.1 The X-Representation	21
2.2 The Quantum Statistical Scheme	
2.2.1 Statistical operators	25
2.2.2 The Liouville equation	28
2.2.3 Operator U_{t,t_0}	29
2.2.4 Properties of statistical operators	33
2.3 Symmetry Properties	35
2.4 Discrete X-Representation	41
2.5 Discrete Momentum Representation	44
2.6 Compatibility with Schrödinger's Equation	45
2.7 Limiting and Cyclic Conditions	48
2.8 Time-Independent Hamiltonians	51

2.9	Conservation and Non-Conservation of Particle Numbers	
2.9.1	Partial wavefunctions	54
2.9.2	X-representation for variable particle numbers	56
2.9.3	Hilbert space of wavefunctions and subspaces	59
2.9.4	Projection operator P_N	61
2.9.5	Combined index w	63

CHAPTER 3

CANONICAL DISTRIBUTIONS AND THERMODYNAMIC FUNCTIONS

3.1	Integrals of Motion	65
3.2	Gibbs Canonical Distribution	66
3.3	Method for Thermodynamic Functions: Assumptions and Definitions	69
3.4	Quasi-Static Processes	
3.4.1	Discussion	72
3.4.2	Construction for quasi-static processes	73
3.4.3	Interpretation of terms	76
3.4.4	Heat capacity C_V	78
3.4.5	Homogeneous systems	79
3.4.6	Relation between H and E	80
3.5	Limiting Transitions	
3.5.1	Basic assumptions	82
3.5.2	Boundary surface	84
3.5.3	Limits	85
3.5.4	Validity of approaches to limiting transitions	86
3.6	Grand Canonical Ensemble	
3.6.1	Statistical operators	87
3.6.2	Definitions: μ, Γ, G	88
3.6.3	Uniqueness of μ_j	90
3.6.4	Thermodynamic functions	94
3.6.5	Limiting transitions as $V \rightarrow \infty$	97
3.7	Quantum Ideas in Classical Canonical Distributions	99
3.8	Entropy in Dynamical Systems	
3.8.1	In canonical ensembles	101
3.8.2	Limiting form of entropy	103
3.8.3	Auxiliary parameter τ and function $R(\tau)$	104
3.8.4	Limiting property	107
3.8.5	Time independence	109
3.8.6	Entropy in non-equilibrium states: Example	110
3.8.7	Approximations for non-equilibrium states	112

CHAPTER 4

TWO-TIME CORRELATIONAL FUNCTIONS AND GREEN'S FUNCTIONS IN THE THEORY OF THERMAL EQUILIBRIUM

4.1	Two-Time Correlational Functions: Representation in Quantum Systems	114
-----	--	-----

4.2	Spectral Intensity $J_{A,B}$	
4.2.1	Definition	119
4.2.2	Properties	120
4.3	Two-Time Green's Functions: Retarded and Advanced	
4.3.1	Definitions	122
4.3.2	Fourier representations	122
4.3.3	Limiting transitions	123
4.3.4	Further properties	125
4.4	Infinitesimal Perturbations	
4.4.1	Perturbed Hamiltonians	128
4.4.2	Infinitesimal change $\delta\langle A \rangle_t$	128
4.4.3	Retarded and advanced functions	132
4.4.4	Further discussions	133
4.5	Green's Functions for Classical Systems	
4.5.1	Correlation functions and spectral intensity	135
4.5.2	Expectation values of Poisson brackets	139
4.5.3	Retarded and advanced functions	141
4.5.4	Further observations	143
4.6	Classical Perturbation $\delta\langle A \rangle_t$	146
4.7	Laplace Transformation of Correlation Functions	150
	REFERENCES FOR PART I	154

PART II : SECOND QUANTIZATION

AUTHORS' NOTE ON PART II

CHAPTER 1

MATRIX REPRESENTATION OF SYMMETRICAL DYNAMICAL OPERATORS

1.1	Introduction	157
1.2	Symmetry Properties	
1.2.1	Permutation P	159
1.2.2	Symmetry and antisymmetry	160
1.3	Symmetrical Operators	
1.3.1	Symmetric one-point operators	161
1.3.2	Symmetric two-point operators	162
1.3.3	Symmetric s-point operators	164
1.4	Identities	165
1.5	Hamiltonians	168

CHAPTER 2

OCCUPATION NUMBERS: TRANSLATION FROM CONTINUOUS TO DISCRETE REPRESENTATIONS

2.1 Representations

2.1.1 Discrete f -representation	170
2.1.2 Discrete momentum representation	172
2.1.3 Periodicity: Fourier integral representations	173
2.1.4 Limiting transitions: Quasi-discrete representation	175

2.2 Occupation Numbers

2.2.1 Representation and definitions	175
2.2.2 Bosons	178
2.2.3 Fermions	180

CHAPTER 3

SECOND QUANTIZED REPRESENTATION FOR WAVEFUNCTIONS IN BOSE AND FERMI STATISTICS

3.1 Case of Bose Statistics

3.1.1 Operators a, a^\dagger	182
3.1.2 Bose quantum operators a_f, a_f^\dagger	184
3.1.3 Wavefunctions	185

3.2 Case of Fermi Statistics

3.2.1 Operators σ, σ^\dagger	188
3.2.2 Pauli operators b, b^\dagger	190
3.2.3 Fermi operators a_f, a_f^\dagger	192
3.2.4 Wavefunctions	195

3.3 Comparisons: Bosons and Fermions

3.4 Second Quantized Representation	198
3.5 Particle Number	201

CHAPTER 4

SECOND QUANTIZED REPRESENTATION FOR DYNAMICAL OPERATORS

4.1 Bases for Transformations to Second Quantized Representations	204
4.2 Lemma	
4.2.1 Proof	206
4.2.2 Corollary	209
4.3 Wavefunctions C, ϕ	
4.3.1 Transformation and correspondence	211
4.3.2 Invariance of scalar product	212

4.4	Transformation of Dynamical Quantities to Second-Quantized Representation	
4.4.1	Procedure for transformation	213
4.4.2	One-point operator U	214
4.4.3	Space density ρ	216
4.4.4	Particle number operator N	217
4.4.5	Two-point operator B	219
4.4.6	s -point operator $\sigma^{(s)}$	220
4.5	Second Quantized Representation for Hamiltonian H	222
4.6	Time Evolution of Operator Functions	
4.6.1	Heisenberg representation	224
4.6.2	Transformation relations	225
4.6.3	Equation for time evolution	226
4.6.4	Discussion	228
CHAPTER 5		
GENERAL REMARKS ON THE SECOND QUANTIZATION METHOD		
5.1	Particle Number Independent Systems	
5.1.1	Grand canonical ensemble	230
5.1.2	Quasi-discrete representation	231
5.1.3	Discrete and operator functions	232
5.1.4	Second quantized representation of Hamiltonian Γ	233
5.1.5	Momentum vector \vec{P}	235
5.2	Second Quantization Wavefunction C	
5.2.1	Conditions and definitions	236
5.2.2	Consequences of condition (D)	237
5.2.3	Derivation of expression for C	238
5.3	Multiple Particle Types: 2 Type Boson-Fermion System	
5.3.1	Ordinary wavefunctions	244
5.3.2	Second quantization operator functions ψ, ψ^\dagger and wavefunction C	244
5.3.3	Transformation for dynamical quantities	246
5.3.4	Two-particle type dynamical variables	248
5.3.5	Particle number independent Hamiltonian	250
5.4	Commutation Relations of ψ, ψ^\dagger	
5.4.1	Arbitrary commutability	251
5.4.2	Conventions	253
5.5	Comments on Chapter 2: Occupation Number and f Representations	
5.5.1	Bosons	255
5.5.2	Fermions	257

CHAPTER 6
ANALOGUES OF THE SECOND QUANTIZATION METHOD IN CLASSICAL MECHANICS

6.1	Second Quantized Treatment	
6.1.1	Time evolution of the Wigner quantum operator	260
6.1.2	Limit as $\hbar \rightarrow 0$	264
6.1.3	First and second quantization	264
6.2	Classical Treatment	
6.2.1	Two-body dynamical variable B	266
6.2.2	Time-evolution of function f	267
6.2.3	Vlasov's equation	269
6.3	Elastic Spheres	
6.3.1	System of two identical elastic spheres	
	(i) State function F	272
	(ii) Time evolution of F	278
	(iii) Pseudo-operator $T(1,2)$ and non-penetrability	279
6.3.2	System of N identical elastic particles	
	(i) State function F	280
	(ii) Function f	280
	(iii) Expansion of $T(j, j_1)f_j$	281
	(iv) Boltzmann-Enskog equation	284
	(v) Example	287
	(vi) General two-body interactions	290
