Finite Element Techniques for Fluid Flow

J. J. CONNOR, SC.D.
Professor of Civil Engineering
Massachusetts Institute of Technology, USA

C. A. BREBBIA, PH.D.
Senior Lecturer in Civil Engineering
University of Southampton, UK

H
Technische Hochschule Darmstadt
Fachbereich Mechanik
Bibliothek
Inv.-Nr. BM 386176

Contents

1 Weighted Residual and Variational Methods 1

1.1 Basic definitions
1.2 Weighted residual methods
1.3 Weak formulations
1.4 Initial value problems
*1.5 The case of quadratic functionals
*1.6 Rayleigh–Ritz method
*1.7 Subsidiary conditions

2 The Finite Element Technique 57

2.1 Localised functions
2.2 The finite element technique
2.3 Element matrices
2.4 System equations
2.5 Solution of the system
2.6 The general program

3 Interpolation Functions 100

3.1 Introduction
3.2 First-order continuity functions for triangular elements
3.3 First-order continuity functions for rectangular elements
*3.4 Isoparametric elements
*3.5 Second-order continuity functions for rectangular elements
*3.6 Second-order continuity functions for triangular elements

4 Basic Principles and Governing Equations of Fluid Mechanics 145

4.1 Eulerian and Lagrangian formulations: material derivative
4.2 Deformation rate measures
4.3 Equilibrium equations
4.4 The energy equation
4.5 Constitutive equations—Newtonian fluid
4.6 Navier–Stokes equations—incompressible Newtonian fluid
4.7 The principle of virtual power
4.8 Turbulence

5 Inviscid Fluids 174

5.1 Basic principles
5.2 Bernoulli's principle
5.3 The wave equation
5.4 Harmonic response of coastal waters
5.5 Stream function formulation
*5.6 Cylindrical coordinates

6 Flow Through Porous Media 207

6.1 Principles of groundwater flow
6.2 Confined seepage problems
6.3 Problems involving free surfaces
*6.4 Transient free surface flow
*6.5 Confined aquifer analysis
*6.6 Unconfined aquifer analysis

7 Shallow Water Circulation Problems 233

7.1 Shallow water equations
7.2 Finite element formulation
7.3 Numerical integration schemes
7.4 Lake circulation

8 Dispersion Problems 258

8.1 Introduction
8.2 The mass transfer equation

8.3 Diffusion problems
8.4 Diffusion and convection problems
*8.5 Nonlinear diffusion

9 Viscous Incompressible Flow Problems **281**

*9.1 Introduction
*9.2 Basic principles
*9.3 Stream function—vorticity approach
*9.4 Pressure and velocities approach
*9.5 Free surface flow

Appendix Numerical integration formulae **304**

Index **308**

* Topics which may be omitted in an introductory course without affecting continuity.
