Foreword ix

Preface xi

1 Basic Theory and Notation for Multilayer Filter Calculations

1.1	Notation for multilayer calculations	2
1.2	Reflectance and transmittance at an interface	3
1.3	Single film calculations	6
1.4	Multilayer calculations	9
1.5	Alternative formulation for multilayer calculations	12
1.6	Periodic multilayers and the classical stack	14
1.7	Effect of reflection from the back surface of the substrate	19
1.8	Graphical methods of calculation	24
1.9	Calculation of field intensities inside a multilayer	25

2 Design of Filters by Analytical Techniques

2.1	Classification of the most important types of filter	30
2.2	Achromatised designs for antireflection coatings (Liddell 1966) – an illustration of the graphical method	34
2.3	The 'two effective interface' method	40
2.4	Design of broad band high-reflectance coatings	46
2.5	Use of equivalent index techniques in multilayer design	50

3 Application of Electrical Filter Design Techniques

3.1	Basic notation and definition of terms used in network synthesis	55
3.2	Young's synthesis of antireflection coatings (1961)	57
3.3	Seeley's synthesis of interference filters	61
3.4	The multilayer circuit analogy method	64
3.5	Chen's iteration for the circuit analogy method	71

4 The Use of Merit Function Techniques in Multilayer Design

4.1	Baumeister's successive approximations method	75
4.2	Automatic design methods	78
4.3	The least squares method of Heavens and Liddell	80
4.4	Dobrowolski's method for completely automatic synthesis of thin-film systems	87
4.5	Multilayer synthesis method of Pelletier, Klapisch and Giacomo	94
4.6	Chen's turning value method	98
4.7	Reduction of polarisation effects in designs	102

5 Fourier Transform Methods of Synthesis

5.1	The approximate vector method	109
5.2	The exact synthesis method	111
5.3	The thin-film synthesis program of Dobrowolski and Lowe	113

6 Theoretical Determination of Optical Constants of Thin Films

6.1	Formulae for reflectance and transmittance of a single absorbing film on a transparent substrate	119
6.2	Use of the Hadley–Dennison curves for determining n and k	121
6.3	Bennett and Booty's method	122
6.4	Abelès and Théye's method	123
6.5	Calculation of optical constants and thickness by Ward *et al*	124
6.6	Other single wavelength methods	125
6.7	Hansen's theory for optical characterisation	125
6.8	Kramers Kronig analysis method	127
6.9	Determination of optical constants of weakly absorbing thin films	130
6.10	Use of dispersion formulae	133

7 Thickness Monitoring Techniques and Methods for Analysing Errors in Monitoring

7.1	Computer simulation of errors in monitoring	143
7.2	Baumeister's sensitivity analysis method (1962)	145
7.3	Ritchie's analysis of random errors in narrow band filters	149
7.4	Investigation of errors in the turning value monitoring method	149

7.5 'Dynamic' errors in monitoring 156
7.6 Monitoring systems which employ two or more wavelengths 161
7.7 Filters containing layers with unequal optical thicknesses 164

Appendix 1 A Brief Summary of Optimisation Techniques Useful for a Multilayer Filter Designer

A1.1 Introduction 168
A1.2 Methods for unconstrained optimisation 168
A1.3 Methods for minimising sums of squares of non-linear functions 170
A1.4 Methods for constrained optimisation 172
A1.5 Use and availability of optimisation routines in program libraries 173

Appendix 2 Computer Programs

A2.1 Program for calculating reflectance and transmittance of a non-absorbing, non-dispersive film 175
A2.2 Specification of the N^2 scan automatic design program NSQ2 180
