Contents

1. INTRODUCTION TO QUANTITATIVE ANALYSIS	1
Business decisions. Abstraction. Model building. Solutions. Errors. Model-building techniques. Decisions and probability.	
2. A SURVEY OF PROBABILITY CONCEPTS	14
Objective and subjective probabilities. Basic statements of probability. Mutually exclusive events. Independent events. Dependent events. Conditional, marginal, and joint probabilities. Revision of probabilities. Random variables. The mean of a random variable. Sums of random variables. The variance and standard deviation of a random variable. The Bernoulli process and the binomial distribution. The binomial probability distribution. The binomial probability function.	
3. CONDITIONAL AND EXPECTED VALUE	45
Conditional value. The loss table. Expected monetary value. Expected opportunity loss. Expected utility. Expected profit with perfect predictions. Expected value of perfect information. Sensitivity analysis of subjective probabilities. Decision trees.	
4. DECISION THEORY	68
The decision problem. Decision criteria. Maximax. Equally likely. Minimax. Maximum likelihood. Bayes decision rule. Linear functions.	
5. DECISIONS AND REVISION OF PROBABILITIES	82
The value of imperfect information. Summary.	
6. DECISION THEORY AND CLASSICAL STATISTICS	97
Classical statistics. Probability of error. Incorporating consequences.	

7. THE NORMAL PROBABILITY DISTRIBUTION AND THE VALUE OF INFORMATION	110
Cumulative mass functions. Cumulative distribution functions. The normal probability distribution. Right and left tails. Normal probability tables. Normal prior probabilities and the value of information.	
8. REVISION OF NORMAL PROBABILITIES	131
The probability distributions. Revising the prior distribution. Revision of the standard deviation. The posterior normal distribution and decision making.	
9. DECISION MAKING WITH NORMAL PROBABILITIES	143
The initial situation. The expected posterior distribution. The expected value of sample information. The sampling decision. Optimum sample size.	
10. INVENTORY CONTROL AND UNCERTAINTY: NO REORDERING	157
Fixed demand under certainty. Uncertainty with perfect information. Uncertain demand. A marginal approach. Value of additional information. Cost of ill will. Using a continuous probability distribution.	
11. INVENTORY CONTROL WITH REORDERING AND CERTAIN DEMAND	172
Inventory control with known demand. Sensitivity of costs to errors in Q . Assuming a continuous flow of product. Demand is known: Back-ordering is allowed. APPENDIX 1: Production lot size. APPENDIX 2: Inventory model with back orders.	
12. INVENTORY CONTROL WITH REORDERING AND UNCERTAIN DEMAND	185
The assumptions. The model. Optimal order point—A marginal approach. Total expected cost. Summary. APPENDIX: The determination of the optimum order point and order size. The total annual expected cost.	
13. INTRODUCTION TO LINEAR PROGRAMMING	199
Formulation of linear programming problems. A graphic solution. Limitations of linear programming.	
14. LINEAR PROGRAMMING: THE SIMPLEX METHOD	229
The simplex method.	

- 15. LINEAR PROGRAMMING: THE DUAL PROBLEM AND SENSITIVITY ANALYSIS** 260
- Shadow prices. Sensitivity analysis. Parametric programming.
- 16. LINEAR PROGRAMMING: THE TRANSPORTATION PROBLEM** 290
- Basic method. Same example: Alternative method. Economic interpretations. APPENDIX: The transportation problem expressed in conventional equation form. Supply not equal to demand.
- 17. UTILITY AS A BASIS FOR DECISION MAKING** 314
- Utility. Measuring utility. The psychological assumptions. Derivation of a utility function for money. Using utility functions. Utility functions and risk preference.
- 18. GAME THEORY** 337
- Games. Two-person zero-sum games. Mixed strategies: A zero-sum game. Mixed strategies and games against nature. Evaluation of minimax strategy. Nonzero-sum games. Uncertain payoffs. APPENDIX: Linear programming solution to two-person zero-sum games.
- 19. WAITING LINES: QUEUING THEORY** 359
- Experience and queues. Mathematical models of queuing. A single-service facility. Arrivals from an infinite population. The model. Multiple-service facilities. One-service facility: Arrivals from a finite source. APPENDIX 1: The Poisson process and distribution. APPENDIX 2: Derivation of basic queuing formula.
- 20. SIMULATION** 380
- Simulation and inventory control. Risk analysis. Simulation of complex systems. APPENDIX: Simulation with continuous probability distributions.
- 21. PERT (PROGRAM EVALUATION AND REVIEW TECHNIQUE)** 398
- Information requirements. CASE I: Known activity times. Network diagram. The critical path. Algorithm for critical path. Slack and critical path. Time-cost trade-offs. CASE II: Uncertain activity times. Multiple time estimates for uncertain activity times. Simulation of PERT networks. Evaluation of PERT.

22. MARKOV PROCESSES	420
<p>Calculation of steady-state probabilities. Characteristics of a Markov process. Use of Markov processes in decision problems. Steady-state solution to larger problems. APPENDIX: Steady-state and transient behavior of a two-state Markov process.</p>	
23. DYNAMIC PROGRAMMING	448
<p>Formalizing the dynamic programming technique. Principle of optimality. Formulation and solution of dynamic programming problems. Dynamic programming under uncertainty. APPENDIX: The use of dynamic programming in Markov processes.</p>	
24. BRANCH AND BOUND	485
<p>The branch-and-bound technique. Steps of branch-and-bound method. Other applications of branch-and-bound method.</p>	
APPENDIX OF TABLES	
A. The standardized normal distribution function, $F(Z)$	500
B. $N(D)$ —loss function	501
C. Cumulative binomial distribution $P(R \geq r n, p)$	502
INDEX	519
