Contents

Preface *page* ix

1 Introduction 1

General nature of combinatorial programming problems
Combinatorial programming and spatial analysis
Planning and combinatorial optimization

2 Exact methods of solving combinatorial programming problems 7

Integer linear programming
Tree-searching methods
A branch and bound algorithm
A backtrack programming algorithm
Discrete dynamic programming
General observations on tree-searching methods

3 Heuristic methods of solving combinatorial programming problems 39

General characteristics of heuristic programming
Solution networks and heuristic programming
General solution procedures for heuristic programs
Karg and Thompson's algorithm for solution of the travelling salesman problem
Cooper's algorithm for partitioning a point set
Increasing the flexibility of heuristic programs
Two heuristic algorithms for solution of the optimal network problem
Concluding comments on heuristic programming

4 Basic elements of spatially-structured combinatorial programs: the assignment, transportation, and trans-shipment problems 58

The assignment problem
The transportation problem
The trans-shipment problem
Some general characteristics of spatial programming problems

5 Trees, paths and circuits 68

The minimal spanning tree problem
Steiner minimal trees
The shortest path problem
The problem of the *k*th shortest path
Hamiltonian circuits
Vehicle delivery problems and the multiple Travelling salesman problem

6 Complex networks 95

Construction costs and operating costs
First approximations: some linear programming approaches to the solution of complex network problems
Combinatorial approaches to network amelioration problems
The optimal network problem
Multistage network optimization problems
Elaborations of the optimal network problem
General design and organization problems
Concluding comments on complex networks

7 Location-allocation systems 118

Basic elements of location-allocation analysis
A fundamental location-allocation problem (the optimal partitioning problem)
Extensions of the basic location-allocation problem
Special cases of the location-allocation problem
Methods of solving location-allocation problems
Some practical location-allocation problems

8 Dynamic location-allocation systems 143

A dynamic location-allocation problem
A myopic optimization process
Dynamic programming of a location-allocation system
Concluding comments on dynamic location-allocation systems

9 Special grouping and partitioning problems 155

Combinatorial problems of taxonomic description
Combinatorial regionalization problems
Political districting and apportionment

10 Conclusion 164

Bibliography 166
