

FRACTURE PROCESSES of CONCRETE

*Assessment of
Material Parameters
for Fracture Models*

Jan G. M. van Mier

CRC Press

Boca Raton New York London Tokyo

TABLE OF CONTENTS

1. INTRODUCTION: SETTING THE STAGE

1.1 Cracking in concrete and concrete structures	1
1.2 Limit theories of materials and structures	3
1.3 Different levels of observation	5
1.4 Experiments and (numerical) simulations	7
1.5 Organisation of the book	11

PART 1. STRUCTURE AND MECHANICAL BEHAVIOUR

2. STRUCTURE OF CEMENT AND CONCRETE

2.1 Structure of cement	17
2.1.1 Raw materials and clinkers	18
2.1.2 Hydration of cement	21
2.1.3 Water-cement ratio and porosity	27
2.1.4 Structural models for hardened cement paste	30
2.2 Structure of concrete	33
2.2.1 Aggregates, types and properties, particle distributions	33
2.2.2 Interface between aggregates and cement matrix	38
2.2.3 Interface properties: strength and fracture energy	46
2.3 Final remarks	52

3. MECHANICAL BEHAVIOUR OF CONCRETE

3.1 Introduction	55
3.2 Uniaxial compression	56
3.2.1 Initial stiffness	56
3.2.2 Microcracking and micromechanisms	60
3.2.3 Stress-deformation response	68
3.2.4 Post-peak behaviour and localization of deformations	70
3.2.5 Effect of material composition	80
3.2.6 Loading rate and load cycling	83
3.2.6.1 Effect of loading rate	84
3.2.6.2 Cyclic loading	85
3.3 Uniaxial tension (Mode I)	88
3.3.1 Microcracking and micromechanisms in tension	89
3.3.1.1 Impregnation	92
3.3.1.2 Optical microscopy	97
3.3.2 Effect of material structure on tensile softening	102
3.3.2.1 Effect of particle size and particle type	102
3.3.2.2 Effect of water-cement ratio and porosity	106
3.3.2.3 Effect of curing conditions	107

3.3.3 Effect of load-cycling, fatigue and impact	110
3.4 Shear (mode II, III and mixed modes)	114
3.4.1 Different approaches to shear fracture	115
3.4.1.1 Linear fracture mechanics approach	116
3.4.1.2 Mixed-mode I and II fracture energy?	119
3.4.1.3 Extension of the fictitious crack model for shear	120
3.4.2 Does mode II fracture in concrete exist ?	128
3.4.3 Short note on mode III fracture	131
3.5 Multiaxial states of stress	132
3.5.1 Micromechanisms	133
3.5.2 Failure contours	134
3.5.2.1 Biaxial failure contours	134
3.5.2.2 Triaxial failure contours	136
3.5.2.3 Bounding surfaces from constant displacement-ratio tests	141
3.5.3 Stress-strain behaviour	143
3.5.4 Failure under multiaxial stress	150
3.6 Final remarks	154

PART 2. EXPERIMENTAL AND MODELLING TOOLS

4 EXPERIMENTAL TOOLS

4.1 Loading equipment	157
4.1.1 Load- versus displacement-controlled testing	158
4.1.2 Selecting the control variable	162
4.1.2.1 General set-up of a stable fracture experiment	162
4.1.2.2 Examples of advanced fracture experiments	166
a. Four-point-shear experiments	166
b. Hydraulic fracture tests	171
c. Multiaxial compression experiments	173
4.1.3 The importance of boundary conditions	177
4.1.3.1 Frictional restraint	178
a. Uniaxial compression experiments	178
b. Beam experiments	188
4.1.3.2 Boundary rotations	189
a. Boundary rotations in uniaxial tensile experiments	190
b. Maintaining uniformity of deformations in a three-jack system	199
4.1.3.3 Platen interactions	200
4.2 Specimen selection	202
4.2.1 Specimen surface	204
4.2.2 About notches	205
4.2.3 Size and scale of specimens and materials	207

4.2.4 Specimen shape	210
4.3 Data acquisition	212
4.4 Crack detection techniques	215
4.4.1 Local surface deformation measurements	216
4.4.2 Full-field surface deformation measurement techniques ..	220
4.4.2.1 Photo-elastic coating techniques	221
4.4.2.2 Interferometry techniques	222
4.4.2.3 Stereo-photogrammetry	223
4.4.3 Microscopy, impregnation and image analysis	224
4.4.4 Acoustic techniques	230
4.4.5 Other techniques	233
4.4.6 Concluding remarks	235
4.5 Theory of experimental designs	235
4.6 The need for standard testing	241
4.6.1 Fracture energy and tensile softening	243
4.6.2 Compressive strength and softening	250

5. MODELLING AS A TOOL FOR TEST INTERPRETATION

5.1 Introduction	253
5.2 Representing the material	255
5.2.1 Continuum or lattice	255
5.2.2 Mapping the material structure	259
5.3 Fracture laws for continuum based models	264
5.3.1 Classical Strength of materials law: brittle failure	265
5.3.2 Linear elastic fracture mechanics	272
5.3.2.1 Irwin's model	275
5.3.2.2 Griffith theory	279
5.3.2.3 Example of crack growth analysis	281
5.3.2.4 Application of LEFM at the meso-level	284
5.3.3 The Dugdale-Barenblatt plastic crack tip	290
5.3.4 Fictitious crack model	291
5.3.4.1 Principle of the model	292
5.3.4.2 Stability considerations	295
5.3.4.3 Crack-band width	298
5.3.4.4 Mixed fracture modes	299
5.3.5 Summary of the basic models	301
5.4 Fracture laws for lattice type models	301
5.4.1 An atomic view on fracture	302
5.4.2 Fracture laws for beam models	306

PART 3. SYNTHESIS

6. VALIDATION OF MODEL PARAMETERS

6.1 Introduction	315
------------------------	-----

6.2 Fictitious crack model	315
6.3 Lattice model	320
6.3.1 Parameters related to the elastic lattice properties	321
6.3.2 Fracture parameters	324
6.3.3 Small particle effect, porosity and 3D-effect	328
6.3.3.1 Omitting small particles	328
6.3.3.2 Including porosity	330
6.3.3.3 3D-effects	332
7. NUMERICAL SIMULATION OF PLAIN CONCRETE	
FRACTURE EXPERIMENTS	
7.1 Introduction	337
7.2 Uniaxial tension	339
7.2.1 Crack face bridging	339
7.2.2 Effect of boundary rotations on tensile softening	344
7.2.3 Non-uniform opening: comparing different approaches ..	348
7.3 Combined tension and shear	350
7.3.1 “Shear” in a four-point-shear beam?	350
7.3.2 Boundary effects in biaxial tension/shear experiments	354
7.4 Uniaxial compression	357
7.4.1 Lattice model analyses	357
7.4.2 Continuum particle models	358
7.5 Failure contours	361
8. FRACTURE MECHANICS FOR STRUCTURAL ANALYSIS	
8.1 Introduction	367
8.2 Analysis of bond-slip between steel and concrete	368
8.3 Analysis of anchor pull-out	375
8.4 Evaluation of brittleness of structures	384
Appendix: Principal stresses and invariants	389
References	397
Index	423
