\mathcal{B}

An Approach to Econometrics

R.J. ALLARD

Queen Mary College, University of London

Philip Allan

Contents

Preface vii

1 Data analysis without models /

1.1 Introduction 1; 1.2 Scatter diagrams and time series 2; 1.3 Regression lines 9; 1.4 Comparison of scatter diagrams and time series 12; 1.5 Forecasting and models 14; Exercises 17.

2 Least-squares regression 19

2.1 Simple regression 19; 2.2 Residuals and the decomposition of sum of squares 24; 2.3 Correlation 26; 2.4 Multiple regression 28; 2.5 Comparison of simple and multiple regression coefficients 30; 2.6 Sums of squares and multiple correlation 34; 2.7 Stepwise procedure for multiple regression 34; Exercises 36.

3 Probability 39

3.1 Models – deterministic and stochastic 39; 3.2 The ideas of probability 40; 3.3 The axiomatic approach to probability 42; 3.4 Conditional probability 44; 3.5 Independent events 46; 3.6 Random variables 46; 3.7 Expected value and variance 49; 3.8 Joint probability distributions 52; 3.9 Further results on expected values and variances 55; 3.10 Continuous random variables 57; 3.11 The normal distribution 60; Exercises 63.

4 Statistical inference 66

4.1 Introduction 66; 4.2 The distribution of the sample mean 67; 4.3 Estimation 68; 4.4 Hypothesis tests and confidence intervals 72; 4.5 σ^2 unknown 79; 4.6 Comparison of variances 84; 4.7 The likelihood function 85; Exercises 87.

5 Simple regression 90

5.1 Introduction 90; 5.2 Properties of the disturbance term 92; 5.3 Properties of $\hat{\alpha}$ and $\hat{\beta}$ 93; 5.4 Estimation of σ^2 98; 5.5 Confidence intervals and hypothesis tests 100; 5.6 Summary of results on simple regression

101; 5.7 A reconsideration of the basic assumptions 104; 5.8 Prediction 106; 5.9 Non-linear relations between variables 109; 5.10 Simple regression with no constant term 111; Exercises 112.

6 Multiple regression 115

6.1 Introduction 115; 6.2 Properties of $\hat{\alpha}$, $\hat{\beta}_1$, $\hat{\beta}_2$ 116; 6.3 Confidence intervals and hypothesis tests 119; 6.4 Multicollinearity and the use of prior information 122; 6.5 Extensions to more than two variables 126; 6.6 Prediction 129; 6.7 Time trends 130; 6.8 Dummy variables 132; Exercises 135.

7 Disturbances and residuals 139

7.1 Introduction 139; 7.2 The nature of the disturbance term 140; 7.3 Correlation of X and u 142; 7.4 The difference between experimental and non-experimental conditions 144; 7.5 The relation between residuals and disturbances 146; 7.6 The variance of $\hat{\beta}$ 149; 7.7 Serial correlation 150; 7.8 Inferring the existence of serial correlation 152; 7.9 Heteroskedasticity 156; 7.10 Wrong form of function for Y 159; 7.11 Some concluding remarks 161; Exercises 162.

8 Single equations: further problems and alternative estimators 166 8.1 Introduction 166; 8.2 Regressions with transformed variables 166; 8.3 Serial correlation 170; 8.4 Errors in variables 173; 8.5 Distributed lags 176; 8.6 Lagged endogenous variables 184; Exercises 187.

9 Simultaneous equations 189

9.1 Introduction 189; 9.2 Structural and reduced form equations 190; 9.3 Identification 192, 193; 9.4 Estimation of reduced form equations 196; 9.5 OLS estimation of structural equations 196; 9.6 Indirect least squares (ILS) 199; 9.7 Two stage least squares (2SLS) 201; Exercises 204.

Appendix A Mathematical notes 207

Appendix B Statistical tables 214

Further reading 221

Numerical answers to odd-numbered exercises 223
