CONTENTS

PREFACE	vii
CONTENTS	ix
NOTATION	xiii
CHAPTER 1. Introduction	1
1.1. The mathematical programming problem	1
1.2. Classical optimization methods	3
1.3. Linear programming	6
1.4. Scope of this book	10
CHAPTER 2. Theory of linear programming	13
2.1. Convex cones and polyhedra	13
2.2. Theory of linear inequalities	16
2.3. Some elementary concepts in linear programming	19
2.4. Optimality and duality in linear programming	23
2.5. Examples and applications of duality	28
CHAPTER 3. The simplex method	35
3.1. Introduction and preliminary remarks	35
3.2. The iteration	37
3.3. Finding an initial basic feasible solution	45
3.4. An example	50
3.5. Degeneracy and anti-cycling precautions	53

CHAPTER 4. Numerical aspects of the simplex method	61
4.1. Introduction	61
4.2. The straightforward algorithm	62
4.3. The explicit inverse algorithm	64
4.4. The product-form algorithm	66
4.5. Variants of the product-form algorithm	77
4.6. A product-form algorithm using LU-decomposition	84
4.7. Pivot column selection	95
4.8. Automatic scaling of the original matrix	99
CHAPTER 5. Other methods for linear programming	103
5.1. The dual simplex method	103
5.2. The primal-dual method	109
5.3. Methods of feasible directions	113
CHAPTER 6. Special structures	117
6.1. Totally unimodular matrices	117
6.2. The transportation problem	122
6.3. Network flow problems	132
6.4. Bounded variables problems	147
6.5. Generalized upper bounds	155
CHAPTER 7. Post-optimal analysis	161
7.1. Range analysis	161
7.2. Matrix changes	162
7.3. Parametric programming	164
7.4. Conditional maximization of a second objective function	171
CHAPTER 8. Decomposition and partitioning methods	173
8.1. Introduction	173
8.2. Primal decomposition	174
8.3. Dual decomposition	184
8.4. Primal partitioning	192
8.5. Dual partitioning	199

CHAPTER 9. Integer and mixed integer linear programming	211
9.1. Introduction	211
9.2. Cutting plane methods for pure integer programming	214
9.3. Explicit enumeration	225
9.4. Mixed integer linear programming	247
9.5. The travelling salesman problem	253
CHAPTER 10. Theory of nonlinear programming	263
10.1. Convex functions and some extensions	263
10.2. Optimality in nonlinear programming	270
10.3. Duality in nonlinear programming	277
10.4. Application to geometric programming	281
CHAPTER 11. General principles of a method of feasible directions	289
11.1. Introduction	289
11.2. Finding an initial feasible solution	290
11.3. Determination of a usable feasible direction	293
11.4. Steplength determination	295
CHAPTER 12. Direction generators	303
12.1. Introduction	303
12.2. Optimization methods	304
12.3. Feasibility methods	306
12.4. Global methods	311
12.5. The projection problem	313
12.6. Numerical aspects of various direction generators	319
CHAPTER 13. Linear programming and the methods of feasible directions	327
13.1. Introduction	327
13.2. An example	330
13.3. Special problems	332

13.4. A finite method for primal partitioning	334
13.5. Chebyshev approximation	338
CHAPTER 14. Unconstrained optimization	345
14.1. Introduction	345
14.2. Some convergence theorems	346
14.3. Classical methods	348
14.4. Methods of conjugate directions for quadratic functions	352
14.5. Methods of conjugate feasible directions	360
14.6. Quasi-Newton methods	370
14.7. Methods that do not require the calculation of derivatives	380
CHAPTER 15. Quadratic programming	383
15.1. Introduction	383
15.2. Methods based on the optimality conditions	384
15.3. Methods of conjugate feasible directions	395
15.4. Quasi-Newton methods	407
CHAPTER 16. Linearly constrained nonlinear programming	411
16.1. Introduction	411
16.2. The linear approximation method	413
16.3. Methods of conjugate feasible directions	416
16.4. Quasi-Newton methods	422
CHAPTER 17. General nonlinear programming	425
17.1. Introduction	425
17.2. Barrier function and penalty function methods	426
17.3. Special methods for special problems	440
17.4. Direct methods	457
17.5. Primal-dual methods	469
17.6. Branch and bound methods for non-convex problems	476
