Table of contents

List of symbols and abbreviations

1 Introduction and outline of the thesis **1**

1.1 Research on unsaturated soils 1

1.2 Open issues 2

1.3 Focus and outline of the thesis 4

2 Design and theoretical studies of a new two-phase flow field test **7**

2.1 Introduction 7

2.2 Literature review: inverse modelling theory 8

2.2.1 General principle 8

2.2.2 Objective function and minimization 10

2.2.3 Weighting of observations and prior information 12

2.2.4 Convergence 14

2.2.5 Evaluation of model fit 15

2.3 Computational framework 18

2.3.1 General 18

2.3.2 FT_2009 19

2.3.3 Constitutive laws 23

2.3.4 UCODE_2005 26

2.3.5 Executing a UCODE_2005 – FT_2009 parameter optimization 28

2.4 Design of the field test and numerical simulation of test performance 29

2.4.1 Experimental setup 29

2.4.2 Numerical model and soil parameters 32

2.4.3 Simulation results 34

2.5 Inverse modelling studies with synthetic observation data 39

2.5.1 General description 39

2.5.2 Variant 1 40

2.5.3 Variant 2 41

2.5.4 Variant 3 42

2.6 Summary and conclusions 43

3 Execution and inverse modelling of air injection field tests 47

3.1 Introduction 47

3.2 Literature review: inverse modelling of transient flow experiments 48

3.2.1 General information 48

3.2.2 Examples 48

3.2.3 Conclusions 52

3.3 General test procedure 53

3.3.1 Test site and ground conditions 53

3.3.2 Installation of the experimental set-up 55

3.3.3 Air pressure control and measurement 58

3.3.4 Inverse modelling specifications 60

3.4 Field test 1 61

3.4.1 General 61

3.4.2 Presentation and discussion of measurements results 62

3.4.3 Inverse modelling 65

3.5 Field test 2 71

3.5.1 General 71

3.5.2 Presentation and discussion of measurements results 71

3.5.3 Inverse modelling 75

3.6 Field test 3 80

3.6.1 General 80

3.6.2 Presentation and discussion of measurements results 81

3.6.3 Interpretation of the test performance 85

3.7 Discussion of results 87

3.8 Summary and conclusions 89

4 Numerical investigations of steady-state unsaturated conductivity tests 93

4.1 Introduction 93

4.2 Literature review: steady-state methods 95

4.2.1 The constant-head method 95

4.2.2 The constant-flow method 97

4.2.3 The centrifuge method 98

4.3 Numerical simulations 99

4.3.1 Permeameter system and general concept 99

4.3.2 Numerical model and material parameters 102

4.3.3 Simulations results 104

4.3.4 Discussion and interpretation of results 111

4.4 Correcting the steady-state derived conductivity 113

4.4.1 The Smiles and Towner method 113

4.4.2 A new reference suction 115

4.4.3 Inverse modelling 120

4.5 Summary and conclusions 123

5 Installation, calibration and first results of a triaxial testing device 125

5.1 Introduction 125

5.2 Theoretical aspects and literature review: mechanical behaviour of unsaturated soils 126

5.2.1 Micro-mechanical considerations 126

5.2.2 Experimental evidence 131

5.2.3 Stress-state variables and constitutive model classes 136

5.3 Triaxial apparatus for unsaturated soils 141

5.3.1 General principles and techniques 141

5.3.2 Double-walled triaxial cell 142

5.3.3 Volume change device 144

5.3.4 Complete testing system 145

5.4 Initial problems and improvements 147

5.5 Calibration and sensitivity tests 149

5.5.1 General information 149

5.5.2 Volume change device 150

5.5.3 Double-walled cell 151

5.6 Experimental study 154

5.6.1 General description 154

5.6.2 Testing procedure 156

5.6.3 First test results 159

5.7 Summary and conclusions 164

6 Case study: Tunnel Fritzens – analysis and prediction of air losses 167

6.1 Introduction 167

6.2 Tunnelling under compressed air 168

6.3 The Tunnel Fritzens 169

6.3.1 Situation 169

6.3.2 Geological and hydrogeological conditions 171

6.3.3 Driving scheme 172

6.3.4 Measured air losses 174

6.4 Computation method 175

6.5 Investigation of air losses through the tunnel lining 177

6.5.1 Analysis of the measured air losses 177

6.5.2 Numerical model and calibration procedure 178

6.5.3 Computations with different excess air pressures 181

6.5.4 Identification of air losses through the lining 182

6.6 Investigation of air losses through the tunnel face 183

6.6.1 Analysis of the measured air losses 183

6.6.2 Numerical model and calibration procedure 185

6.6.3 Bottom extension of grout column-roof-umbrella 187

6.6.4 Two-staged top-heading excavation 189

6.7 Characteristic air loss predictions 190

6.7.1 General concept 190

6.7.2 Default advance scheme 191

6.7.3 Alternative advance schemes 192

6.7.4 Comparison of the total amount of air need 193

6.8 Air loss prediction for bench excavation 195

6.8.1 General information 195

6.8.2 Numerical model and material parameters 195

6.8.3 Air loss predictions 197

6.9 Summary and conclusions 199

7 Conclusions and outlook 203

8 Bibliography 207
