Contents

-
- 1. Stockless production: Basic concepts** 1

Flexible automation: Short setup times. Market-paced run rates + Flexibility = Small lot sizes. Developing the manufacturing process to do it right the first time: Perfect quality. Reducing production operations to the minimum necessary. Preventive maintenance to improve production capability. Stockless production: Accomplished by people. Developing an entire industry as a single factory. Stockless production: A revolution for business planning and strategy. Inventory level as an indicator of total production efficiency. Broad scope of application. Appendix: Glossary of terms.
 - 2. Results of stockless production in practice** 22
 - 3. Identifying problems through the production control system** 37

What is a pull system? The Toyota card control system. Use of the control system to stimulate process improvement. Variations in the card system. Other visibility systems for production control. Appendix: Circulating containers at Master Lock Corporation in Milwaukee.

- 4. Planning production to execute a level schedule** 58
 Developing the level final assembly schedule. Matching the final assembly schedule to market demand. Rescheduling the final assembly schedule. The production planning process leading to the final assembly schedule. Appendix: A basic pull system at Hoover Company.
- 5. Converting the plant for flow and flexibility** 83
Setup-time reduction: 1. Examine and reexamine what a setup is to accomplish. 2. Study the existing setup procedures. 3. Do as much external setup as possible—with the machine running. 4. Eliminate as much adjustment time as possible. 5. Practice and refine the setup procedures. Summary of setup-time reduction. Layout and housekeeping: Stockless production work rules. Assembly layout. Coordinated setup of equipment linked by material flows.
- 6. Manufacturing process systems: Flow balancing** 119
 Group technology and balancing fabrication operations. Balancing the plant. Preventive maintenance. Visibility systems. Working into full automation. Equipment selection.
- 7. Quality systems in stockless production** 150
 Quality action: Permanent improvement of process control. Improving process control by improving process capability: *Summary of developing process control*. Cause and effect: Making the plant into a production laboratory: *Keep everyone aware of the state of product quality—and process quality. Organize records so as to classify problems and point to causes. Use methods for tracing defects or other problems to their sources. Make detailed comparisons of operations. Organize a cause-and-effect analysis. Experimenting: The surest way to build knowledge of cause and effect.* Quality circles and other groups for process improvement.
- 8. Product design and stockless production** 180
 Value engineering. Design of options and of the production process: *Broadcast systems. What is required to produce a large variety of optional items by a pull system. Design of options for production by pull systems.* New models and engineering changes. Effect of stockless production on design engineering.
- 9. The supplier network** 202
 History of suppliers to Japanese major industries. Japanese supplier transport network. American experiments to reduce pipeline inventories. Improving quality from suppliers. Stable schedules and delivery

signals given to suppliers: *Supplier schedules in a stockless production industry*. Supplier networks conflict with established custom.

10. Planning and measurement of stockless production 231

Planning for an upper limit on pipeline inventory: *Pulsed flow: How many cards for each part?* The changeover between schedules. Measuring results and performance: *Inventory systems. Cost accounting. Performance measurement.*

11. Implementing stockless production 257

Organizational changes: *Study. Offer a guarantee of employment?* Physical action program: *Pilot projects. Organization, layout, and housekeeping. Improving process capability and quality-control procedures. Setup-time reduction. Material-handling design. Leveling the schedule: Preparing for a pull system. Conversion: Installing the pull system. Consolidating the system.* Appendix: Tokai Rika Company implements their total production system.

X 12. Stockless production and manufacturing strategy 295

Stockless production in overall corporate strategy: *Production strategy.* The job shop, MRP, and stockless production. Working with suppliers: Developing an industry. Strategy for implementing stockless production.
