Modeling Complex Systems

Second Edition

Springer

Contents

Preface of the First Edition	vii
Preface of the Second Edition	ix
Notations	xv
1 Introduction	1
1.1 What is a Complex System?	2
1.2 What is a Model?	6
1.3 What is a Dynamical System?	11
Exercises	18
Solutions	19
Summary	23
2 How to Build Up a Model	25
2.1 Lotka-Volterra Model	26
2.2 More Realistic Predator-Prey Models	33
2.3 A Model with a Stable Limit Cycle	34
2.4 Fluctuating Environments	36
2.5 Hutchinson's Time-Delay Model	37
2.6 Discrete-Time Models	40
2.7 Lattice Models	41
Exercises	45
Solutions	46
Summary	49
3 Differential Equations	53
3.1 Flows	54
3.2 Linearization and Stability	64
3.2.1 Linear Systems	64
3.2.2 Nonlinear Systems	69
3.3 Graphical Study of Two-Dimensional Systems	79

3.4	Structural Stability	82
3.5	Local Bifurcations of Vector Fields	85
3.5.1	One-Dimensional Vector Fields	86
3.5.2	Equivalent Families of Vector Fields	96
3.5.3	Hopf Bifurcation	97
3.5.4	Catastrophes	100
3.6	Influence of Diffusion	105
3.6.1	Random Walk and Diffusion	106
3.6.2	One-Population Dynamics with Dispersal	107
3.6.3	Critical Patch Size	108
3.6.4	Diffusion-Induced Instability	110
	Exercises	113
	Solutions	115
	Summary	123
4	Recurrence Equations	127
4.1	Iteration of Maps	127
4.2	Stability	130
4.3	Poincaré Maps	138
4.4	Local Bifurcations of Maps	140
4.4.1	Maps on $\mathbb{R}$	141
4.4.2	The Hopf Bifurcation	146
4.5	Sequences of Period-Doubling Bifurcations	148
4.5.1	Logistic Model	148
4.5.2	Universality	152
	Exercises	157
	Solutions	160
	Summary	167
5	Chaos	171
5.1	Defining Chaos	174
5.1.1	Dynamics of the Logistic Map f_4	176
5.1.2	Definition of Chaos	180
5.2	Routes to Chaos	181
5.3	Characterizing Chaos	183
5.3.1	Stochastic Properties	183
5.3.2	Lyapunov Exponent	185
5.3.3	“Period Three Implies Chaos”	186
5.3.4	Strange Attractors	188
5.4	Chaotic Discrete-Time Models	197
5.4.1	One-Population Models	197
5.4.2	The Hénon Map	199
5.5	Chaotic Continuous-Time Models	202
5.5.1	The Lorenz Model	202

Exercises	204
Solutions	206
Summary	214
6 Spatial Models	219
6.1 Cellular Automata	220
6.2 Number-Conserving Cellular Automata	223
6.3 Eventually Number-Conserving Cellular Automata	237
6.4 Approximate Methods	240
6.5 Generalized Cellular Automata	247
6.6 Kinetic Growth Phenomena	253
6.7 Site-Exchange Cellular Automata	261
6.8 Agent-Based Spatial Models	276
6.9 Sociophysics	278
Exercises	299
Solutions	303
Summary	318
7 Networks	325
7.1 The Small-World Phenomenon	325
7.2 Graphs	327
7.3 Random Networks	331
7.4 Small-World Networks	335
7.4.1 Watts–Strogatz Model	335
7.4.2 Newman–Watts Model	338
7.4.3 Highly Connected Extra Vertex Model	339
7.5 Scale-Free Networks	339
7.5.1 Empirical Results	339
7.5.2 A Few Models	344
Exercises	350
Solutions	353
Summary	364
8 Power-Law Distributions	371
8.1 Classical Examples	371
8.2 A Few Notions of Probability Theory	378
8.2.1 Basic Definitions	378
8.2.2 Central Limit Theorem	382
8.2.3 Lognormal Distribution	386
8.2.4 Lévy Distributions	387
8.2.5 Truncated Lévy Distributions	391
8.2.6 Student's t -Distribution	392
8.2.7 A Word About Statistics	394
8.3 Empirical Results and Tentative Models	397
8.3.1 Financial Markets	397

8.3.2	Demographic and Area Distribution	401
8.3.3	Family Names	402
8.3.4	Distribution of Votes	403
8.4	Self-Organized Criticality	404
8.4.1	The Sandpile Model	404
8.4.2	Drossel-Schwabl Forest Fire Model	405
8.4.3	Punctuated Equilibria and Darwinian Evolution	407
8.4.4	Real-Life Phenomena	409
	Exercises	414
	Solutions	417
	Summary	430
