

Highway Construction and Maintenance

Second Edition

John Watson B.Sc., M.I.C.E.

Contents

Acknowledgements	vii
List of abbreviations	ix
1 Basics	1
● historical note ● the aims of highway engineering ● paying for roads ● the nature of a pavement ● modes of failure ● causes of failure ● pavement life ● the influence of traffic ● elements of highway engineering	
2 Highway construction materials	21
● introduction ● <i>in situ</i> soils ● tests for soils ● disadvantageous soils ● bitumens ● cement and lime ● aggregates for bound materials ● bituminous materials ● cement bound materials ● geotextiles	
3 Pavement foundation	58
● general principles ● sources of capping material ● the modification of subgrade properties ● the subbase ● subsurface water ● construction of capping and subbase	
4 Flexible bases and surfacing	73
● introduction ● characteristics of a successful bound layer ● roadbase ● an analytical design method for bituminous pavements ● a standard design method ● the selection and design of flexible materials ● the specification of bituminous materials ● construction of flexible surfaces	
5 Concrete and composite pavements	106
● introduction ● design of jointed concrete pavements ● construction of concrete pavements ● specification requirements	
6 Alternative paving types	134
● temporary roads ● light duty roads ● small element paving ● urban design ● kerbs	
7 Highway drainage	152
● introduction ● drainage components ● design ● the effects of subsurface water	
8 Highway design	179
● introduction ● major roads ● estate road layout	
9 Highway maintenance	200
● introduction ● the management problem ● data capture ● the empirical interpretation of results ● repair techniques: flexible pavements ● repair techniques: rigid pavements
