Contents

Preface xi
Acknowledgments xiii

Part I: Flow, Pressures, and Tension in the Arteries

Chapter 1. Possibilities and Scientific Basis for Accurate Measurement of Pressure Gradients in the Aorta
1. The Modern Importance of Basic Data 1
2. The *Windkessel* Effect 3
3. Catheterization and Pressure Transducers 5
4. Pressure as Basic Data versus Velocity as Basic Data 10
5. The Pressure-Differential Velocity Probe 13
6. Flowmeters That Require a Chest Opening 15
7. Studies of Free-Ranging Animals 16
8. Continuum Models 18
9. Microcirculation 18

Chapter 2. Pulsatile Flow in Rigid Tubes with a Given Pressure Gradient
1. Importance of Pulsatility in Blood Flow 23
2. The Differential Equation and Boundary-Value Problem 26
3. Time-Asymptotic Uniqueness, a Uniqueness Up to Transients 30
4. Point Velocity as a Series Solution Corresponding to a Given Analytic Pressure Gradient 33
5. Convergence of the Point Velocity Series 38
6. A Representative Volume Flow Rate by Iteration 40
7. Volume Flow Rate under a Weakened Assumption on the Given Pressure Gradient 43
8. Possibilities for Future Development 44

Chapter 3. A Theory of Flows in Elastic Tubes
1. Differential Equation and Boundary Conditions 47
2. The Significance of Wall Compliance Effects on Flows in the Aorta 53
3. Asymptotic Uniqueness for Flows Satisfying a *Windkessel* Condition 56
4. An Existence Theorem Assuming a Given Wall Motion 61
5. Mathematical Prerequisites for the Existence Proof 64
6. The Newton Method on a Banach Space: Theorems of Kantorovich and Altman 68
7. Setting the Mathematical Problem 74
8. Preliminary Results 76
9. A Solution Using the Kantorovich Theorem 80
10. Two Sequences of Linear Boundary-Value Problems 83
11. A Solution Using Altman's Theorem 85
12. Summary of the Existence Theory for Equations (3.4) and (3.5) 87
13. Stability with Respect to the Occurrence of Radial Components 88

Chapter 4. A Proposed Wall Tension and Flow Computation Method
1. The Laplace Law for Equilibrium Pressure and Circumferential Tension 91
2. Approximate Computation of Velocity in Terms of the Radius by One Picard-Type Correction 96
3. A Differential Equation for the Tension-versus-Stretch Relation 101
4. Computation of Velocity and Tension from v^1 in terms of r 104
Chapter 5: Computations of Flow Using Newton-Raphson Methods
1. The Newton-Raphson Method as a "Self-Improvement" Procedure 107
2. Preference for the Modified Method 109
3. The Modified Newton-Raphson Method Used to Compute Flows in Compliant Channels 110
4. The Newton-Raphson Method Used to Compute Flows in Compliant Channels 113
5. *Comments on Finite-Difference Methods* 114
6. A Direct Evaluation of Wall Tension *in Vivo* 116
7. Significance of This Study for the Physiology of Blood Flow 118
Appendix: A Class of Bernoulli Laws 121
References 122

Part II: Toward a Mathematical Description of the Electrical Behavior of Electrically Active Cells

Introduction 127

Chapter 6. Gross Properties of Nerve, Muscle, and Other Electrically Active Cells
1. An Outer-Space "Model" 133
2. Axon of a Nerve 134
3. Nerve Cells and Specialized Junctions between Them 144
4. Skeletal Muscle Fibers 149
5. Smooth Muscle Tissue 150
6. Heart Cells 152
7. *Receptor Cells* 157
8. Summary 158
Chapter 7. Reformulation of the Hodgkin-Huxley System of Partial Differential Equations
1. The Role of Individual Contributors in Large Enterprises 161
2. *An Empirical Study of the Electrical Properties of a Squid Membrane* 164
3. Linear Laws for Electrical Components 173
4. Classical Transmission Lines 175
5. The Kelvin r-c Line 182
6. Heaviside's r-c-l Distortion-Free Marine Cable 187
7. *Contributions of Riemann, Du Bois-Reymond, and Picard to the Heaviside Position* 193
8. The Kelvin Line Revisited 197
9. Propagation of Electrical Impulses on Nerve Fibers 205
10. Summary 214
Chapter 8. Mathematical Analysis of Some Basic Properties of the Reformulated Hodgkin-Huxley Differential Equations
1. Purposes 215
2. Existence and Uniqueness for the Characteristic Boundary-Value Problem for $\psi_{xy} = f$ 217

3. Existence and Uniqueness for the Initial-Value (Cauchy) Problem for $\psi_{xy} = f$ 228
4. Application of the Existence-Uniqueness Theory for Initial-Value Problems to the Reformulated Equations . . . 234
5. Riemann's Method for the Linear Second-Order Hyperbolic Equation in Two Independent Variables . . . 239
6. Representation of the Solution of the Cauchy Problem for the Telegraphists' Equation in Terms of the Riemann Function . . . 248
7. New Integral Equations for Two Initial-Value Problems for the Reformulated Equations Using Riemann's Method . . . 250
8. The Ordinary Differential Equation System as a Singular Perturbation . . . 254
9. The Ordinary Differential Equation System as a Time-Asymptotic ("Steady") State . . . 257
10. Discussion of Sizes and Importance of L, H, and A . . . 258
11. Toroidal Current Sheets . . . 260
12. Inductance of Toroidal Coils . . . 262
13. Toroidal Coordinates . . . 262
14. Maxwell's Equations and Their Consequences for Toroidal Current Sheets . . . 263
15. Inductance of a Cylindrical Packet of Toroidally Composed Loops . . . 266
16. A Recapitulation . . . 270
17. Direct Observations of Large Magnetic Fields Propagating on Axons . . . 271
18. Works in Magnetobiology . . . 272
19. A Speculation about Membrane Mechanisms . . . 273

Chapter 9. Numerical Investigations of the Basic Properties of the Reformulated Hodgkin-Huxley Equations
1. Corroborative Calculations and Parameter Studies . . . 277
2. A "Cut-End" Calculation: Transient Development of the "Steady State" . . . 279
3. A Skeletal Muscle Fiber Calculation . . . 291
4. The Reformulated Ordinary Differential Equation System . . . 292
5. Tests of the Singular Perturbation Procedures . . . 295
6. Comparison of the Singular Perturbation Procedure for the Reformulated and the Original Equations . . . 299
7. Repetitive Firing, Successive Current Thresholds and Their Limits . . . 302
8. Analogue Computer Studies of the Reformulated Equations . . . 313

Chapter 10. Other Numerical Treatments Using the Reformulated Equations
1. Purpose . . . 327
2. Ephaptic Initiation in Closely Packed Cylindrical Cells . . . 329
3. The Partial Differential Equations for Noncylindrical Thin Axons . . . 337
4. The Ordinary Differential Equations for Noncylindrical Thin Axons . . . 341
5. Synapse Threshold Calculations . . . 346
6. Summary of Work on Noncylindrical Axons . . . 348
