Fachbereich Mechanik
Bibliothek
Inv.-Nr. BM 32/88

CONTENTS

Foreword V

1. Introduction 1
1.1. On theoretical research in fluid mechanics 1
1.1.1. Some general remarks 1
1.1.2. Equations governing flow of newtonian fluids 5
1.1.3. On formulation and solution of mathematical problems of fluid mechanics 13
1.2. Scope of the book 16
References 17

2. Conformal mapping of multiply connected domains 18
2.1. The standard one-step mapping function 18
2.1.1. Two kinds of physical domains 18
2.1.2. Some properties of conformal mapping 19
2.1.3. Pre-determined auxiliary domains: existence and uniqueness of the mapping function 21
2.1.4. The general form of the mapping function 23
2.2. Parameters of the mapping function 26
2.3. Determination of the parameters (I) 32
2.4. Determination of the parameters (II) 35
2.4.1. General concept of an algorithm 35
2.4.2. Uniformisation 38
2.4.3. Projection. Accuracy of mapping 46
2.4.4. Final remarks 48
2.5. Determination of the parameters (III). 50
2.6. Some particular domains 53
2.6.1. Introductory remarks 53
2.6.2. Regular domains 53
2.6.3. Reducible domains 55
2.7. Examples of conformal mapping 60
2.7.1. Scope of the Section 60
2.7.2. Conformal representation of single contours 61
2.7.3. Systems of contours in infinite domains 73
2.7.4. Systems of contours in finite domains 91
2.8. Application of an intermediary mapping 103
2.9. Comment 110

References 112

3. Steady, plane, irrotational flow of inviscid and incompressible fluid 114
3.1. Fundamental properties 114
3.1.1. Particular form of the conservation laws. Some further relations 114
3.1.2. Stream function, complex potential, and complex velocity. Singularities 117
3.2. Mathematical problem in domains bounded by impermeable contours. Part 1: formulation 119
3.2.1. Types of flow 119
3.2.2. Boundary conditions. 121
3.2.3. Various formulations of the problem 122
3.2.4. Uniqueness. The Kutta-Joukowski condition 124
3.3. Mathematical problem in domains bounded by impermeable contours. Part 2: general solution 128
3.3.1. Transformation of the problem by conformal mapping. . 128
3.3.2. Standard form of the complex velocity. 131
3.3.3. Determination of the coefficients of the complex velocity: general considerations 133
3.3.4. System of equations for the coefficients: the infinite domain 134
3.3.5. System of equations for the coefficients: the finite domain 138
3.3.6. Final remarks 147
3.4. Force and moment acting on a contour 148
3.5. System of profiles in infinite uniform stream 151
3.5.1. Introduction 151
3.5.2. Mapping function and complex velocity 153
3.5.3. Velocity and pressure distribution. 155
3.5.4. Lift, drag, and moment. Generalisation of the Joukowski formula 156
3.5.5. Streamline pattern. Equipotential lines 160
3.5.6. Example 163
3.6. System of profiles in bounded uniform stream 172
3.6.1. Modelling vicinity of the ground 172
3.6.2. Modelling influence of the test section 176
3.7. Flow in finite domains 182

3.8. Application to mapping onto rectangular domains 184
References 187

4. Unsteady, plane, irrotational flow of inviscid, and incompressible fluid 189
4.1. Introduction 189
4.1.1. The fundamental deficiency of the physical model 189
4.1.2. The pressure paradox 191
4.1.3. Some particular models of unsteady flow. 194
4.1.4. Concluding remarks 199
4.2. The method of solution 200
4.2.1. Formulation of the problem 200
4.2.2. Determination of the coefficients. 201
4.2.3. Comment 204
References 205

5. Laminar flow in cylindrical pipes of multiply connected cross sections 207
5.1. Physical assumptions, and formulation of the problem . . . 207
5.1.1. General system of equations 207
5.1.2. Formulation of the original mathematical problem. . 208
5.2. Transformation of the original problem 211
5.2.1. The harmonic part of the solution. 211
5.2.2. Conformal mapping of the domain of solution. . . . 212
5.3. Construction of the solution 213
5.3.1. The complex potential 213
5.3.2. System of equations for the complex coefficients . . 216
5.4. Some properties of the flow 223
5.4.1. The velocity distribution 223
5.4.2. The viscous stress at the wall 235
5.4.3. Action of the wall on the fluid 241
5.4.4. The rate of discharge 243
5.5. Laminar flow vs elastic torsion 249
5.5.1. Introduction 249
5.5.2. Fundamental relations 249
5.5.3. The main differences 252
5.5.4. System of equations stemming from boundary conditions 252

5.5.5. Stresses and torsional rigidity 256
References 262

6. Steady Stokes' flow in plane multiply connected domains 263
6.1. Theoretical background 263
6.1.1. Physical assumptions. The biharmonic equation 263
6.1.2. The Goursat formula 265
6.2. The standard solution 267
6.2.1. Complex velocity in the physical domain 267
6.2.2. Transformation onto the auxiliary domain 268
6.2.3. General formula for the complex velocity 271
6.2.4. Boundary conditions 273
6.3. General formulae expressing some properties of the Stokes' flow 278
6.4. Illustrative examples 280
6.4.1. General remarks 280
6.4.2. Finite domain bounded by a circle. Flow generated by a doublet 281
6.4.3. Finite domain bounded by a circle. Flow generated by sources, or vortices 285
6.4.4. Infinite domain. The classical Stokes' paradox. . . . 287
6.4.5. Infinite domain. Flow around a circle generated by singularities 290
6.4.6. Infinite domain. Flow generated by two rotating discs. 295
6.4.7. Infinite domain. Flow around an arbitrary contour. . . 305
6.5. System of equations for the coefficients 313
6.5.1. Introductory remarks 313
6.5.2. Expansions into complex Fourier series 313
6.5.3. Physical domains bounded by circles 322
6.5.4. Physical domains bounded by arbitrary contours. . . . 326
6.6. Comments 327
References 329
