# CONTENTS

		xi 1
1 Part 1	Preface Introduction	
	2	Quadratic Linear Problems
2-1 2-2	Problem Statement Solution Method	6 10
3	General Nonlinear Models	17
3-1 3-2 3-3 3-4	Problem Statement Quadratic Linear Approximation Method Gradient Methods Special Problems	18 19 22 24
4	Example of Deterministic Control	26
4-1 4-2	System Equations The Criterion Function	26 31
Part 2	Passive-Learning Stochastic Control	
5	Additive Uncertainty	35
5-1	Uncertainty in Economic Problems	35
5-2	Methods of Modeling Uncertainty	36
5-3 5-4	Learning: rassive and Active Additive Error Terms	37 39

5-4 Additive Error Terms

6	Multiplicative Uncertainty	41
6-1	Statement of the Problem	41
6-2	Period N	43
6-3	Period $N-1$	45
6-4	Period k	48
6-5	Expected Values of Matrix Products	49
6-6	Methods of Passive-Learning Stochastic Control	50
7	Example of Passive-Learning Stochastic Control	51
7-1	The Problem	51
7-2	The Optimal Control for Period 0	52
7-3	Projections of Means and Covariances to Period 1	56

### Part 3 Active-Learning Stochastic Control

Overview	63
Problem Statement	64
The Monte Carlo Procedure	67
The Adaptive-Control Problem: Initiation	68
Search for the Optimal Control in Period k	68
The Update	72
Other Algorithms	72
Nonlinear Active-Learning Stochastic Control (with Bo Hyun Kang)	74
Introduction	74
Problem Statement	74
Dynamic-Programming Problem and Search Method	76
Computing the Approximate Cost-to-Go	76
Obtaining a Deterministic Approximation for the Cost-to-Go	84
Projection of Covariance Matrices	85
Summary of the Search for the Optimal Control in Period $k$	89
Updating the Covariance Matrix	90
Summary of the Algorithm	90
Quadratic Linear Active-Learning Stochastic Control (with Bo Hyun Kang)	91
Introduction	91
Problem Statement	91
The Approximate Optimal Cost-to-Go	94
Dual-Control Algorithm	98
Updating State and Parameter Estimates	104
	OverviewProblem StatementThe Monte Carlo ProcedureThe Adaptive-Control Problem: InitiationSearch for the Optimal Control in Period kThe UpdateOther AlgorithmsNonlinear Active-Learning Stochastic Control(with Bo Hyun Kang)IntroductionProblem StatementDynamic-Programming Problem and Search MethodComputing the Approximate Cost-to-GoObtaining a Deterministic Approximation for the Cost-to-GoProjection of Covariance MatricesSummary of the Search for the Optimal Control in Period kUpdating the Covariance MatrixSummary of the AlgorithmQuadratic Linear Active-Learning Stochastic Control (with Bo Hyun Kang)IntroductionProblem StatementThe Approximate Optimal Cost-to-GoDual-Control AlgorithmUpdating State and Parameter Estimates

11	Example: The MacRae Problem	105
11-1	Introduction	105
11-2	Problem Statement: MacRae Problem	105
11-3	Calculation of the Cost-to-Go	107
11-4	The Search	113
12	Example: A Macroeconomic Model with Measurement Error	116
12-1	Introduction	116
12-2	The Model and Data	117
12-3	Adaptive versus Certainty-Equivalence Policies	120
12-4	Results from a Single Monte Carlo Run	122
12-5	Summary	139
	Appendices	142
А	Second-Order Expansion of the System Equations	143
В	Expected Value of Vector and Matrix Products	146
С	Equivalence of Some Matrix Riccati Recursions	149
D	Second Order Kalman Filter	152
Ε	Alternate Forms of the Cost-to-Go Expression	159
F	Expected Value of the Product of Two Quadratic Forms	
	(by Jorge Rizo-Patron)	162
G	Certainty-Equivalence Optimal Cost-to-Go Problem	177
Н	Matrix Recursions for the Augmented System	179
I	Vector Recursions for the Augmented System	188
J	Proof That a Constant Term in the Cost-to-Go Is Zero	193
K	Updating the Augmented State Covariance	195
L	Derivative of the System Equations with Respect to the Parameters	198
Μ	Projection of the Augmented State Vector	202
Ν	Updating the Augmented State Vector	206
0	The Sequential Certainty-Equivalence Method	208
Р	The Reestimation Method	210
Q	Deterministic, Cautionary, and Probing Components of the	
_	Cost-to-Go	211
R	The Measurement-Error Covariance	214
S	Data for Deterministic Problem	217
1	Solution to the Macroeconomic Model with Measurement Error	220
	References	228
	Index	238
