Contents

<i>Preface</i>	v
<i>Acknowledgements</i>	ix
<i>Chapter 1. Historical Background to the Wind Loading Problem</i>	1
1.1. Introduction	1
1.2. Research before 1880	5
1.2.1. Early meteorology	5
1.2.2. Early anemometry	8
1.2.3. Aerodynamics before 1880	10
1.2.4. Early work on wind forces	12
1.3. The Board of Trade Inquiry into the Tay Bridge Disaster, 1880	13
1.4. Research after 1880	14
<i>Chapter 2. Physical Properties of the Wind</i>	23
2.1. Instruments for measuring wind velocity	23
2.1.1. Rotational anemometers	23
2.1.2. Pressure anemometers	25
2.1.3. Hot-wire anemometers	30
2.2. The structure of the wind	33
2.2.1. Large scale factors	33
2.2.2. Effects of ground roughness	36
2.2.3. The effect of temperature gradient	38
2.2.4. Summary	41
2.3. The estimation of design wind velocities	41
2.3.1. Introduction	41
2.3.2. Quasi-static loading	44
2.3.3. Dynamic loading	50
2.3.4. Conclusion	60
<i>Chapter 3. Wind Pressure Forces on Buildings</i>	62
3.1. Elementary concepts of fluid flow	62
3.1.1. Streamlines	62
3.1.2. Continuity equation	62
3.1.3. Bernoulli's equation	63
3.2. Forces on bodies immersed in moving fluids	67
3.2.1. Introduction	67
3.2.2. Pressure and drag coefficients	72

3.3. Wind forces on buildings	80
3.3.1. Pressure forces	80
3.3.2. Frictional drag forces on buildings	104
3.4. Wind forces on lattice structures	105
 <i>Chapter 4. The Design of Buildings to Resist the Wind: Wind Bracing Systems and the Calculation of Wind Forces</i>	 108
4.1. General introduction	108
4.2. Steel frame buildings	109
4.2.1. Introduction	109
4.2.2. Industrial buildings	111
4.2.3. Low- to medium-rise commercial buildings	125
4.2.4. High-rise buildings	127
4.3. Reinforced concrete buildings	133
4.3.1. Rigid frame construction	133
4.3.2. Flat slab construction	133
4.4. Brickwork buildings	144
4.4.1. Introduction	144
4.4.2. Low-rise brickwork construction	145
4.4.3. High-rise brickwork construction	148
 <i>Chapter 5. Dynamics of Structures</i>	 151
5.1. Elementary concepts	151
5.1.1. Single degree of freedom systems	151
5.1.2. Multi-degree of freedom systems	157
5.1.3. Response of structures to random loads	164
5.2. Dynamics of real systems	168
5.2.1. Estimation of natural frequencies	168
5.2.2. Estimation of damping	174
 <i>Chapter 6. The Dynamic Effect of Wind on Buildings</i>	 176
6.1. Introduction	176
6.2. Types of excitation	177
6.2.1. Buffeting by turbulence	177
6.2.2. Vortex excitation	197
6.2.3. Galloping instability	201
6.3. Design of structures to minimise dynamic response	202
6.4. Conclusion	206
 <i>Appendix. The Derivation of the Mathematical Relationships Between the Spectrum of the r^{th} Modal Load Component and the Spectrum of Wind Velocity</i>	 207
 <i>Principal Notation</i>	 210
<i>Conversion Factors</i>	<i>213</i>
<i>References and Bibliography</i>	<i>214</i>
<i>Index</i>	<i>217</i>
