# CONTENTS

	<i>page</i>
<i>Preface</i>	xiii
1 INTRODUCTION	
1 Introduction	1
2 Mechanisms of instability	4
3 Fundamental concepts of hydrodynamic stability	8
4 Kelvin-Helmholtz instability	14
5 Break-up of a liquid jet in air	22
Problems for chapter 1	27
2 THERMAL INSTABILITY	
6 Introduction	32
7 The equations of motion	34
The exact equations, 34; The Boussinesq equations, 35	
8 The stability problem	37
The linearized equations, 37; The boundary conditions, 40; Normal modes, 42	
9 General stability characteristics	44
Exchange of stabilities, 44; A variational principle, 45	
10 Particular stability characteristics	50
Free-free boundaries, 50; Rigid-rigid boundaries, 51; free-rigid boundaries, 52	
11 The cells	52
12 Experimental results	59
13 Some applications	62
Problems for chapter 2	63

## 3 CENTRIFUGAL INSTABILITY

<b>14</b>	Introduction	69
<b>15</b>	Instability of an inviscid fluid	71
	Three-dimensional disturbances, 73; Axisymmetric disturbances, 77; Two-dimensional disturbances, 80	
<b>16</b>	Instability of Couette flow of an inviscid fluid	82
<b>17</b>	The Taylor problem	88
	Axisymmetric disturbances, 90; Two-dimensional disturbances, 103; Three-dimensional disturbances, 104; Some experimental results, 104	
<b>18</b>	The Dean problem	108
	The Dean problem, 108; The Taylor-Dean problem, 113	
<b>19</b>	The Görtler problem	116
	Problems for chapter 3	121

## 4 PARALLEL SHEAR FLOWS

<b>20</b>	Introduction	124
	The inviscid theory	
<b>21</b>	The governing equations	126
<b>22</b>	General criteria for instability	131
<b>23</b>	Flows with piecewise-linear velocity profiles	144
	Unbounded vortex sheet, 145; Unbounded shear layer, 146; Bounded shear layer, 147	
<b>24</b>	The initial-value problem	147
	The viscous theory	
<b>25</b>	The governing equations	153
<b>26</b>	The eigenvalue spectrum for small Reynolds numbers	158
	A perturbation expansion, 159; Sufficient conditions for stability, 161	
<b>27</b>	Heuristic methods of approximation	164
	The reduced equation and the inviscid approximations, 165; The boundary-layer approximation near a rigid wall, 167; The WKBJ approximations, 167; The local turning-point approximations,	

	171; The truncated equation and Tollmien's improved viscous approximations, 175; The viscous correction to the singular inviscid solution, 177	
<b>28</b>	Approximations to the eigenvalue relation	180
	Symmetrical flows in a channel, 181; Flows of the boundary-layer type, 183; The boundary-layer approximation to $\phi_3(z)$ , 184; The WKB approximation to $\phi_3(z)$ , 185; The local turning-point approximation to $\phi_3(z)$ , 188; Tollmien's improved approximation to $\phi_3(z)$ , 191	
<b>29</b>	The long-wave approximation for unbounded flows	196
<b>30</b>	Numerical methods of solution	202
	Expansions in orthogonal functions, 203; Finite-difference methods, 206; Initial-value methods (shooting), 207	
<b>31</b>	Stability characteristics of various basic flows	211
	Plane Couette flow, 212; Poiseuille flow in a circular pipe, 216; Plane Poiseuille flow, 221; Combined plane Couette and plane Poiseuille flow, 223; The Blasius boundary-layer profile, 224; The asymptotic suction boundary-layer profile, 227; Boundary layers at separation, 229; The Falkner-Skan profiles, 231; The Bickley jet, 233; The hyperbolic-tangent shear layer, 237	
<b>32</b>	Experimental results	239
	Problems for chapter 4	245

## 5 UNIFORM ASYMPTOTIC APPROXIMATIONS

<b>33</b>	Introduction	251
	Plane Couette flow	
<b>34</b>	The integral representations of the solutions	256
<b>35</b>	The differential equation method	263
	General velocity profiles	
<b>36</b>	A preliminary transformation	265

<b>37</b>	The inner and outer expansions	267
	The inner expansions, 268; The outer expansions, 271; The central matching problem, 276; Composite approximations, 278	
<b>38</b>	Uniform approximations	280
	The solution of well-balanced type, 280; The solutions of balanced type, 280; The solutions of dominant-recessive type, 283	
<b>39</b>	A comparison with Lin's theory	285
<b>40</b>	Preliminary simplification of the eigenvalue relation	290
<b>41</b>	The uniform approximation to the eigenvalue relation	295
	A computational form of the first approximation to the eigenvalue relation, 299; Results for plane Poiseuille flow, 301	
<b>42</b>	A comparison with the heuristic approximations to the eigenvalue relation	305
	The local turning-point approximation to $\phi_3(z)$ , 305; Tollmien's improved approximation to $\phi_3(z)$ , 306; The uniform approximation to $\phi_3(z)$ based on the truncated equation, 308; The uniform approximation to $\phi_3(z)$ based on the Orr-Sommerfeld equation, 309	
<b>43</b>	A numerical treatment of the Orr-Sommerfeld problem using compound matrices	311
	Symmetrical flows in a channel, 315; Boundary-layer flows, 316	
	Problems for chapter 5	317

## 6 ADDITIONAL TOPICS IN LINEAR STABILITY THEORY

<b>44</b>	Instability of parallel flow of a stratified fluid	320
	Introduction, 320; Internal gravity waves and Rayleigh-Taylor instability, 324; Kelvin-Helmholtz instability, 325	
<b>45</b>	Baroclinic instability	333
<b>46</b>	Instability of the pinch	339
<b>47</b>	Development of linear instability in time and space	345
	Initial-value problems, 345; Spatially growing modes, 349	

<b>48</b>	Instability of unsteady flows	353
	Introduction, 353; Instability of periodic flows, 354; Instability of other unsteady basic flows, 361	
	Problems for chapter 6	363

## 7 NONLINEAR STABILITY

<b>49</b>	Introduction	370
	Landau's theory, 370; Discussion, 376	
<b>50</b>	The derivation of ordinary differential systems governing stability	380
<b>51</b>	Resonant wave interactions	387
	Internal resonance of a double pendulum, 387; Resonant wave interactions, 392	
<b>52</b>	Fundamental concepts of nonlinear stability	398
	Introduction to ordinary differential equations, 398; Introduction to bifurcation theory, 402; Structural stability, 407; Spatial development of nonlinear stability, 416; Critical layers in parallel flow, 420	
<b>53</b>	Additional fundamental concepts of nonlinear stability	423
	The energy method, 424; Maximum and minimum energy in vortex motion, 432; Application of boundary-layer theory to cellular instability, 434	
<b>54</b>	Some applications of the nonlinear theory	435
	Bénard convection, 435; Couette flow, 442; Parallel shear flows, 450	
	Problems for chapter 7	458

APPENDIX. A CLASS OF  
GENERALIZED AIRY FUNCTIONS

<b>A1</b>	The Airy functions $A_k(z)$	465
<b>A2</b>	The functions $A_k(z, p)$ , $B_0(z, p)$ and $B_k(z, p)$	466
<b>A3</b>	The functions $A_k(z, p, q)$ and $B_k(z, p, q)$	472
<b>A4</b>	The zeros of $A_1(z, p)$	477
	<i>Bibliography and author index</i>	479
	<i>Motion picture index</i>	515
	<i>Subject index</i>	517
