Roßdorf

Nr. 176

The bearing and deformation behaviour of concrete subjected to uniaxial compressive short-term loading

VDI Verlag

HLuHB Darmstadt
15269260

TABLE OF CONTENTS

1 INTRODUCTION 1

1.1 Research significance

1.2 Objective

1.3 Approach

2 STATE OF THE ART 5

2.1 Fundamentals of the structure of concrete

2.1.1 Definitions

2.1.2 The interfacial transition zone

2.2 The bearing and deformation behaviour of concrete at the macroscopic level

2.2.1 The stress-strain relation

2.2.2 Lateral strain and volume change

2.2.3 Behaviour for repeated loading and unloading

2.3 Fracture mechanics

2.3.1 Linear elastic fracture mechanics

2.3.2 Non-linear fracture mechanics and the fracture process zone

2.4 Mesoscopical alterations due to compressive loading

2.4.1 Stress distribution with regard to the mesolevel

2.4.2 Experimental observation of the mesostructural behaviour

2.4.3 Numerical simulations with regard to the mesolevel

2.5 Observation techniques to detect alterations in the structure of concrete subjected to mechanical loading

2.5.1 Overview and demands

2.5.2 Strain measurements

2.5.3 Techniques with the use of sonic waves

2.5.4 Visualisation of internal alterations

3 EXPERIMENTAL INVESTIGATIONS 28

3.1 Conception

3.2 Material composition and specimen preparation

3.2.1 Criteria for the choice of the investigated materials

3.2.2 Material composition

3.2.3 Casting, curing and preparation

3.2.4 Specimen size and shape

3.2.5 Compressive strength and density

3.3 Conditions for the compressive tests

3.3.1 Application of compressive load

3.3.2 Testing procedure

3.4 Deformation behaviour

3.4.1 Stress-strain behaviour

3.4.2 The relation of lateral strain to specimen height

3.5 Investigations with ultrasonic transmission

3.5.1 Experimental setup and testing procedure

3.5.2 Calibration

3.5.3 Analysis

3.5.4 Results

3.6 Digital image correlation

3.6.1 Experimental setup and testing procedure

3.6.2 Analysis

3.6.3 Results

3.7 Stereomicroscopy on specimens stabilized with epoxy

3.7.1 Experimental setup and testing procedure

3.7.2 Preparation and observation by stereomicroscopy

3.7.3 Results

3.8 Bond strength between matrix and aggregate

3.8.1 Experimental setup and testing procedure

3.8.2 Results

4 CONCLUSIONS ON THE BEARING AND DEFORMATION PERFORMANCE OF CONCRETE 59

4.1 The fracture process zone

4.2 The boundary zone

4.2.1 Definition

4.2.2 Drafting a basic Finite Element Model for simulating the mesoscoscopical behaviour

4.3 Localization effects in the structure of concrete

4.4 Mesostructural failure process with regard to the concrete composition
4.4.1 Normal concrete
4.4.2 Lightweight concrete
4.4.3 High strength concrete
4.4.4 Comparison of the different concrete compositions
4.5 Mesoscopical discontinuities during decreased loading
4.6 Excursion: The influence of the mesostructure on the propagation of ultrasonic waves

5 A QUANTITATIVE MODEL FOR DESCRIBING THE STRESS-STRAIN BEHAVIOUR OF CONCRETE 79
5.1 Quantifying the mesoscopical deformations
5.2 Analysing and modelling
5.2.1 Main influence parameters
5.2.2 Assumptions and parameters for the model
5.2.3 Modelling
5.3 Verification of the model

6 OUTLOOK 93

APPENDIX 95
A Mix design and material properties
B Digital image correlation technique – results
C Direction of scattering
D Influence of the size of an inclusion on the stress concentration
E Calculation of the volume of matrix, aggregate and boundary zone
