CONTENTS

About the AuthorX	111
Introduction	V
1. TRANSPORTATION SYSTEMS	1
1.1. Definition	1
1.2. Transportation system identification	5
1.2.1. Relevant spatial and supply characteristics	6
1.2.2. Relevant components of transport demand	
1.2.3. Relevant temporal dimensions 1	
1.3. Modeling transportation systems 1	
Reference Notes	2
2. TRANSPORTATION SUPPLY MODELS	3
2.1. Introduction	23
2.2. Congested network models	24
2.2.1. Graph models	25
2.2.2. Performance variables and transportation costs	26
2.2.3. Flows	31
2.2.4. Link performance and cost functions 3	
2.2.5. Impacts and impact functions	
2.2.6. General formulation	
2.3. Applications of Transportation Supply models	
2.3.1. Supply models for continuous service systems	
2.3.1.1. Graph models	19
2.3.2. Supply models for scheduled service systems)0 :0
2.3.2.1. Ene-based graph models	
2.3.2.2. Performance and cost functions	
2.A.1. Models for running links	
2.A.1.1. Fundamental variables	
2.A.1.2. Stationary models	
2.A.1.3. Non-stationary models	
2.A.2. Models for queuing links	
2.A.2.1. Fundamental variables	78
2.A.2.2. Deterministic models	
2.A.2.3. Stochastic models	
2.A.3. Application to signalized intersections	
Reference Notes	
3. RANDOM UTILITY THEORY	5
3.1. Introduction	
3.2. Basic assumptions	96

,

3.3. Some random utility models	101
3.3.1. The Multinomial Logit model	101
3.3.2. The Single-Level Hierarchical Logit model	
3.3.3. The Multi-Level Hierarchical Logit model*	113
3.3.4. The Cross-Nested Logit model*	122
3.3.5. The Generalized Extreme Value (GEV) model*	126
3.3.6. The Probit model	128
3.3.7. The Hybrid Logit-Probit model*	136
3.4. Choice set modeling*	137
3.5. Expected Maximum Perceived Utility and mathematical properties of	
random utility models	141
3.6. Direct and cross elasticities of random utility model	147
3.7. Aggregation methods for random utility models.	151
3.A. Derivation of logit models from the GEV model	157
3.A.1. Derivation of the Multinomial Logit model	157
3.A.2. Derivation of the Single-Level Hierarchical Logit model	158
3.A.3. Derivation of the Multi-Level Hierarchical Logit model	160
3.A.4. Derivation of the Cross-Nested Logit model	163
3.B. Random variables relevant for random utility models	165
3.B.1. The Gumbel random variable	165
3.B.2. The Multivariate Normal random variable	168
Reference Notes	
4. TRANSPORTATION DEMAND MODELS	
4.1. Introduction	
	178
4.2. Trip demand model systems	
4.2. Trip demand model systems 4.3. Examples of trip demand models	184
 4.2. Trip demand model systems 4.3. Examples of trip demand models	184 184
 4.2. Trip demand model systems	184 184 188
 4.2. Trip demand model systems	184 184 188 192
 4.2. Trip demand model systems	184 184 188 192 197
 4.2. Trip demand model systems	184 184 188 192 197 197
 4.2. Trip demand model systems	184 184 188 192 197 197 207
 4.2. Trip demand model systems	184 184 188 192 197 197 207 215
 4.2. Trip demand model systems	184 184 188 192 197 197 207 215 220
 4.2. Trip demand model systems	184 184 188 192 197 197 207 215 220 228
 4.2. Trip demand model systems	184 184 188 192 197 197 207 215 220 228 230
 4.2. Trip demand model systems	184 184 188 192 197 207 215 220 228 230 232
 4.2. Trip demand model systems 4.3. Examples of trip demand models 4.3.1. Emission or trip frequency models 4.3.2. Distribution models 4.3.3. Mode choice models 4.3.4. Path choice models 4.3.4.1. Path choice models for road systems 4.3.4.2. Path choice models for transit systems 4.3.5. A system of demand models 4.4. Trip-chaining demand models 4.5. Applications of demand models 4.6. Freight transport demand models 4.6.1. Multiregional Input-Output (MRIO) models 4.6.2. Freight mode choice models 	184 184 188 192 197 207 215 220 228 230 232 243
 4.2. Trip demand model systems 4.3. Examples of trip demand models 4.3.1. Emission or trip frequency models 4.3.2. Distribution models 4.3.3. Mode choice models 4.3.4. Path choice models 4.3.4.1. Path choice models for road systems 4.3.4.2. Path choice models for transit systems 4.3.5. A system of demand models 4.4. Trip-chaining demand models 4.5. Applications of demand models 4.6.1. Multiregional Input-Output (MRIO) models 4.6.2. Freight mode choice models 	184 184 188 192 197 207 215 220 228 230 232 243
 4.2. Trip demand model systems	184 184 188 192 197 207 215 220 228 230 232 243 245
 4.2. Trip demand model systems. 4.3. Examples of trip demand models. 4.3.1. Emission or trip frequency models. 4.3.2. Distribution models. 4.3.3. Mode choice models. 4.3.4. Path choice models for road systems. 4.3.4.2. Path choice models for transit systems. 4.3.5. A system of demand models. 4.3.5. A system of demand models. 4.6. Freight transport demand models. 4.6.1. Multiregional Input-Output (MRIO) models. 4.6.2. Freight mode choice models. 5. MODELS FOR TRAFFIC ASSIGNMENT TO TRANSPORTATION NETWORKS. 	184 184 188 192 197 207 215 220 228 230 232 243 245
 4.2. Trip demand model systems. 4.3. Examples of trip demand models. 4.3.1. Emission or trip frequency models. 4.3.2. Distribution models. 4.3.3. Mode choice models. 4.3.4. Path choice models. 4.3.4.1. Path choice models for road systems. 4.3.4.2. Path choice models for transit systems. 4.3.5. A system of demand models. 4.4. Trip-chaining demand models. 4.5. Applications of demand models. 4.6.1. Multiregional Input-Output (MRIO) models. 4.6.2. Freight mode choice models. 5. MODELS FOR TRAFFIC ASSIGNMENT TO TRANSPORTATION NETWORKS. 5.1. Introduction 	184 184 188 192 197 207 215 220 228 232 232 243 245 251
 4.2. Trip demand model systems. 4.3. Examples of trip demand models. 4.3.1. Emission or trip frequency models. 4.3.2. Distribution models. 4.3.3. Mode choice models. 4.3.4. Path choice models for road systems. 4.3.4.1. Path choice models for road systems. 4.3.4.2. Path choice models for transit systems. 4.3.5. A system of demand models. 4.4. Trip-chaining demand models. 4.5. Applications of demand models. 4.6.1. Freight transport demand models. 4.6.2. Freight mode choice models. 5. MODELS FOR TRAFFIC ASSIGNMENT TO TRANSPORTATION NETWORKS. 5.1. Introduction. 5.2. Definitions, assumptions, and basic equations. 	184 184 188 192 197 207 215 220 228 230 232 243 243 255
 4.2. Trip demand model systems. 4.3. Examples of trip demand models. 4.3.1. Emission or trip frequency models. 4.3.2. Distribution models. 4.3.3. Mode choice models. 4.3.4. Path choice models for road systems. 4.3.4.1. Path choice models for transit systems. 4.3.5. A system of demand models. 4.3.5. A system of demand models. 4.6. Freight transport demand models. 4.6.1. Multiregional Input-Output (MRIO) models. 4.6.2. Freight mode choice models. 5. MODELS FOR TRAFFIC ASSIGNMENT TO TRANSPORTATION NETWORKS. 5.1. Introduction. 5.2. Definitions, assumptions, and basic equations. 5.2.1. Supply model. 	184 184 188 192 197 207 215 220 228 230 232 243 243 255 255 256
 4.2. Trip demand model systems. 4.3. Examples of trip demand models. 4.3.1. Emission or trip frequency models. 4.3.2. Distribution models. 4.3.3. Mode choice models. 4.3.4. Path choice models for road systems. 4.3.4.1. Path choice models for road systems. 4.3.4.2. Path choice models for transit systems. 4.3.5. A system of demand models. 4.6.1. Trip-chaining demand models. 4.6.1. Multiregional Input-Output (MRIO) models. 4.6.2. Freight mode choice models. 5. MODELS FOR TRAFFIC ASSIGNMENT TO TRANSPORTATION NETWORKS. 5.1. Introduction. 5.2. Definitions, assumptions, and basic equations. 5.2.1. Supply model. 5.2.2. Demand model. 	184 184 188 192 197 207 215 220 228 230 232 243 243 255 255 259

CONTENTS

5.3.1. Models for Stochastic Uncongested Network assignment	. 270
5.3.2. Models for Deterministic Uncongested Network assignment	
5.4. Rigid demand Users Equilibrium assignment models	. 274
5.4.1. Stochastic User Equilibrium models	. 276
5.4.2. Deterministic User Equilibrium models	. 281
5.4.3. Relationship between stochastic and deterministic equilibrium flows	
5.4.4. System optimal assignment models	. 291
5.5. Assignment models with pre-trip/en-route path choice	. 297
5.6. Elastic demand User Equilibrium assignment models*	. 307
5.6.1. Single-mode assignment models	. 311
5.6.1.1. Elastic demand single-mode Stochastic User Equilibrium models	. 313
5.6.1.2. Elastic demand single-mode Deterministic User Equilibrium models	\$ 316
5.6.2. Multi-mode assignment models	. 321
5.7. Multi-class assignment models*	. 324
5.7.1. Differentiated congestion multi-class assignment models	. 327
5.7.2. Undifferentiated congestion multi-class assignment models	. 328
5.8. Inter-period Dynamic Process assignment models*	. 331
5.8.1. Definitions, assumptions and basic equations	. 332
5.8.1.1. Supply model	. 332
5.8.1.2. Demand model	. 333
5.8.1.3. Approaches to Dynamic Process modeling	. 336
5.8.2. Deterministic Process models	. 339
5.8.3. Stochastic Process models	. 345
5.9. Synthesis and application issues of assignment models	. 348
5.A. Optimization models for stochastic assignment	. 357
5.A.1. Stochastic Uncongested Network assignment	. 357
5.A.2. Stochastic User Equilibrium assignment	. 357
Reference Notes	. 360
6. INTRA-PERIOD (WITHIN-DAY) DYNAMIC MODELS*	367
6.1. Introduction	
6.2. Supply models for continuous service systems	. 368
6.2.1. Continuous flow supply models	. 370
6.2.1.1. Variables and consistency conditions	
6.2.1.2. Link performance and travel time functions	. 379
6.2.1.3. Path performance and travel time functions	
6.2.1.4. Dynamic Network Loading models	. 384
6.2.1.5. Formalization of the overall supply model	
6.2.2. Discrete flow supply models	. 388
6.2.2.1. Variables and consistency conditions	. 389
6.2.2.2. Link performance and travel time functions	
6.2.2.3. Path performance and travel time functions	394
6.2.2.4. Dynamic Network Loading models	395
6.2.2.5. Formalization of the overall supply model	397
6.3. Demand models for continuous service systems	398
6.4. Demand-supply interaction models for continuous service systems	403
6.4.1. Uncongested network assignment models	403
6.4.2. User Equilibrium assignment models	406
6.4.3. Dynamic Process assignment models	410
of the Dynamic Freedow designment medicion	
6.5. Models for scheduled service systems	416

6.5.1. Models for regular low-frequency services	. 418
6.5.1.1. Supply models	. 419
6.5.1.2. Demand models	
6.5.1.3. Demand-supply interaction models	. 425
6.5.2. Models for irregular high-frequency services	. 425
6.5.2.1. Supply models	. 425
6.5.2.2. Demand models	. 427
6.5.2.3. Demand-supply interaction models	
Reference Notes	. 433
7. ALGORITHMS FOR TRAFFIC ASSIGNMENT TO	
TRANSPORTATION NETWORKS	435
7.1. Introduction	. 435
7.2. Shortest path algorithms	
7.3. Algorithms for Uncongested Network assignment	
7.3.1. Stochastic Uncongested Network assignment without explicit paths	
enumeration	. 441
7.3.1.1. SUN assignment with Logit path choice model	. 441
7.3.1.2. SUN assignment with Probit path choice model	. 448
7.3.2. Deterministic Uncongested Network assignment without explicit paths	
enumeration	. 453
7.4. Algorithms for rigid demand User Equilibrium assignment	. 456
7.4.1. Rigid demand Stochastic User Equilibrium	. 457
7.4.2. Rigid demand Deterministic User Equilibrium	. 461
7.4.3. Algorithms for System Optimal Assignment	. 466
7.5. Algorithms for assignment with pre-trip/en-route path choice	
7.5.1. Shortest hyperpath algorithms	. 467
7.5.2. Algorithms for Uncongested Network assignment with	470
pre-trip/en-route path choice 7.5.3. Algorithms for rigid demand User Equilibrium assignment	4/2
with pre-trip/en-route path choice	173
7.6. Extensions of User Equilibrium assignment algorithms*	475
7.7. Applicative issues of assignment algorithms	
Reference Notes	482
8. ESTIMATION OF TRAVEL DEMAND FLOWS	185
8.1. Introduction	
8.2. Direct estimation of present demand	486
8.2.1. Sampling surveys	
8.2.2. Sampling salveys	488
8.3. Disaggregate estimation of demand models	492
8.3.1. Model specification	
8.3.2. Model calibration	
8.3.3. Model validation	
8.4. Disaggregate estimation of demand models with Stated Preferences	
surveys*	508
8.4.1. Definitions and types of survey	509
8.4.2. Survey design	511
8.4.3. Model calibration	517
8.5. Estimation of O-D demand flows using traffic counts	522

8.5.1. Maximum Likelihood and GLS estimators*	
8.5.2. Bayesian estimators*	533
8.5.3. Applicative issues	535
8.5.4. Solution methods	
8.6. Aggregate calibration of demand models using traffic counts	542
8.7. Estimation of intra-period dynamic demand flow using traffic counts*	
8.7.1. Simultaneous Estimators	553
8.7.2. Sequential Estimators	554
8.8. Applications of demand estimation methods	555
8.8.1. Estimation of present demand	555
8.8.2. Estimation of demand variations (forecasting)	557
Reference Notes	559
9. TRANSPORTATION SUPPLY DESIGN MODELS	
9.1. Introduction	
9.2. General formulations of the Supply Design Problem	569
9.3. Some applications of Supply Design models	
9.3.1. Models for road network layout design	572
9.3.2. Models for road network capacity design	576
9.3.3. Models for transit network design	577
9.3.4. Models for pricing design	581
9.3.5. Models for mixed design	583
9.4. Some algorithms for Supply Design Models	584
9.4.1. Algorithms for the discrete SDP	584
9.4.2. Algorithms for the continuous SDP	591
Reference Notes
