*Preface* *page xi*

I	Introduction	1
1	Foreword	1
2	The historical background of economic analysis	1
3	A hint at Mercantilism and at Physiocracy	4
4	The 'Classical' approach to economic reality	5
5	Marginal economic analysis	8
6	The baffling 1870s	11
7	The theory of marginal productivity	14
8	New contributions to economic theory	17
9	An alternative conception of the material world	19
10	A pure production model	23

## **Part I A multi-sector model of economic growth**

II	Production in the short run	29
1	A well-diversified economic system	29
2	Production by means of labour alone: a very simple case	30
3	A necessary condition for full employment	33
4	Production by means of labour and capital goods	35
5	The physical stocks and flows of the economic system	37
6	The structure of prices	39
7	A more complex model involving capital goods for the production of capital goods	43
8	Simplifications	46
9	The equilibrium conditions	46
10	Towards a dynamic analysis	49

CONTENTS

III	The simplest case of economic expansion – population growth with constant returns to scale	50
	1 A simple dynamic model	50
	2 The conditions for a dynamic equilibrium	51
	3 A more complete formulation of the effective demand condition	55
	4 The dynamic movements of relative prices, physical quantities and other economic variables	56
	5 Elegant features of the present case of economic growth	59
IV	Technical change and the dynamics of demand	61
	1 Technical progress in macro-economic models	61
	2 A hypothetical economy with uniform technical progress and uniform expansion of demand	62
	3 Analytical properties of the two cases of economic growth considered so far	64
	4 The production aspect of technical change	66
	5 The demand aspect of technical change	68
	6 Modifications needed to the current theory of demand	70
	7 Sketch of a theory of the dynamics of consumers' demand – a hierarchy of needs and wants	71
	8 Dynamics of demand continued – learning as a more basic process than rational behaviour	75
	9 The evolution of demand over time	76
	10 The criterion for the choice of the hypotheses – variables and constants as against unknowns and data	77
V	A general multi-sector dynamic model	80
	1 The hypotheses:	80
	A. Initial conditions	80
	B. Movements through time	81
	2 Restrictions	83
	3 The flows of the economic system	84
	4 The conditions for a dynamic equilibrium	85
	5 Impossibility of automatically maintaining full employment through time	87
	6 A third special case of proportional economic growth	88
	7 Full employment as an actively pursued target of economic policy	88

## CONTENTS

8	A central Agency entrusted with the task of keeping full employment	91
9	The dynamic movements of physical quantities and relative prices	91
10	The structural dynamics of employment	94
11	The dynamic movements of capital/output and capital/labour ratios	97
12	The price system through time – a degree of freedom at time zero and a degree of freedom among the rates of change	99
13	The ‘standard’ rate of growth of productivity	101
14	A ‘dynamic’ standard commodity	104
15	Macro-economic variables through time	106
16	Short-run flexibilities	108
VI	The empirical significance of vertically integrated analysis	109
1	Vertically integrated sectoral analysis versus input–output analysis	109
2	Fitting empirical data into a vertically integrated sectoral model	112
3	The rationale of framing a dynamic analysis in terms of vertically integrated sectors	114
	Appendix to Chapter VI – A criticism of the Von Neumann-type of dynamic models, as applied to economic systems with technical change	118

## Part II Economic dynamics theory

VII	The ‘natural’ features of a growing economic system	127
1	Foreword	127
2	Two basic properties	127
3	The ‘natural’ rates of profit	128
4	A labour theory of value and a labour theory of the rate of profit	131
5	The two basic functions of the price system	133
6	The ‘real’ wage rate as a macro-economic concept	136
7	The determination of relative prices and physical quantities in a dynamic context	138
8	The dynamic paths of the wage rate and the rate(s) of profit	142

CONTENTS

9	Total profits and total wages – an asymmetrical relation	143
10	New investments	144
11	Total consumption	146
12	Profits and wages, savings and consumption in the 'natural' economic system	146
13	The consumption goods basis of a pure labour theory of value	148
14	The 'natural' economic system and the two levels of economic efficiency	148
15	Profits and savings in a capitalist economy	151
16	The role of institutions	153
VIII	The 'natural' rate of interest	156
1	Personal savings as distinct from over-all savings	156
2	The emergence of financial assets and liabilities	156
3	The emergence of a rate of interest	158
4	A whole series of own-rates of interest, implied by the same (actual) rate of interest	159
5	The 'nominal' or 'money' rate of interest	160
6	Price changes and the 'rate of inflation'	161
7	The relation between the nominal rates of interest and the 'real' rates of interest – the 'standard' real rate of interest	164
8	The correct problem concerning the rate of interest	166
9	The 'natural' rate of interest	166
10	Natural rate of interest and income distribution	168
11	The more general case of production with labour and capital goods	171
12	Rates of interest versus rates of profit	173
13	Rate of interest and rate of profit in capitalist economic systems	174
IX	The accumulation of capital and related problems	176
1	Capital accumulation as a condition for equilibrium growth	176
2	Four quantitative notions of 'capital'	177
3	The distinction essential for dynamic analysis	179
4	Ambiguities in the concept of 'roundaboutness': capital intensity versus degree of mechanisation (or capital/output ratio versus capital/labour ratio)	180

## CONTENTS

5	Capital intensity and degree of mechanisation in comparisons through time	183
6	Capital intensity and degree of mechanisation in comparisons of different economic systems	184
7	The so-called 'Leontief paradox', no longer a paradox in the present theoretical context	186
8	Choice of technique versus changes of technique	188
9	The choice-of-technique function	189
10	The determinants of the choice of technique	191
11	Rate of profit and choice of technique	192
12	Wage rate and choice of technique	194
13	The meaning of cost minimisation in the 'natural' economic system	198
14	Asymmetry between rate of profit and wage rate mirroring the deeper asymmetry between capital and labour	198
15	'Genuine' production functions	200
16	Neo-classical production functions and the irrelevance of marginal productivities	201
17	The process of change of technique	205
18	The meaning of technical progress	206
19	A classification of technical progress	208
20	Alternative criteria of 'neutrality' of technical progress and their information contents	212
21	Increase of the degree of mechanisation, appearing as a process of 'substitution' of capital for labour	215
22	The determinants of capital intensity	216
23	Rate of interest and total investments in capitalist systems	217
X	The structural dynamics of a growing economic system	219
1	Technical change as a decision-generating process	219
2	Structural dynamics of prices and the movement of the general price level	219
3	Structural dynamics of production and the organisational necessity of aiming at steady growth	222
4	A digression on the relevant decisions at the level of the single production units	225
5	Technological unemployment and labour mobility as a consequence of technical progress	226
6	Declining industries in a process of economic growth	229

## CONTENTS

7	The periodic recurrence of short-run difficulties to full employment	232
8	Fluctuations in a process of economic growth	236
9	Say's law and under-consumption theories – a re-appraisal	240
XI	International economic relations	245
1	Limited international mobility	245
2	International comparisons at the same structure of commodity prices	245
3	A fallacy arising from the Heckscher-Ohlin model	247
4	The primary source of international gains	249
5	The order of priority in the expansion of demand as a strict limitation to international learning	250
6	Trade – a secondary source of international gains	253
7	The effects of international trade	256
8	Correcting two widespread views	258
9	The once-for-all character of the gains from international trade	260
10	The remarkable closedness of economic systems as regards productivity gains	261
11	International movements of workers and exploitation	262
12	A 'general' principle of comparative productivity-change advantage	263
13	Terms of trade between primary products and manufactures – a digression	266
14	A 'special' principle of comparative productivity-change advantage and the structural dynamics of international trade	268
15	Economic policy implications	271
16	The wealth of nations	274
	Index	277
