<i>Welcome to the book</i>	xx

1 Introduction: why biologists need chemistry	1
1.1 Science: revealing our world	2
I'm a biologist: what has chemistry to do with me?	3
1.2 The essential concepts	4
1.3 The language of chemistry	7
Units: making sense of numbers	8
Symbols	9
2 Atoms: the foundations of life	10
2.1 The chemical elements	10
2.2 Atomic composition	12
Protons, electrons, and electrical charge	13
Identifying the composition of an atom: atomic number and mass number	14
The formation of ions	15
Isotopes: varying the number of neutrons	17
Relative abundances and atomic weight	18
Protons and chemical identity	21
2.3 Atomic structure	22
Atomic orbitals	22
2.4 The energy of atoms	24
Orbitals and energy levels	24
Filling up orbitals—the building-up principle	25
The filling of subshells	27
Moving between orbitals: electron excitation	29
Energy levels and quantization	32
2.5 Valence shells and valence electrons	33
Valence electrons and the underlying logic of the periodic table	35
The variety of life: not so varied after all?	36

3	Compounds and chemical bonding: bringing atoms together	38
3.1	The formation of compounds	38
	The chemical bond: bridging the gap between atoms	38
	Which electron configuration is most stable?	39
3.2	Valence shells and Lewis dot symbols	41
	Non-bonding pairs of electrons	42
3.3	Bond formation: redistributing valence electrons	43
3.4	The ionic bond: transferring electrons	45
	Ionic bonding and full shells: how many electrons are transferred?	46
3.5	The chemical formula	50
3.6	The covalent bond: sharing electrons	50
	Covalent compounds and electrical charge	52
	The molecular formula: identifying the components of a covalent compound	52
	Covalent bonding and the distribution of electrons	53
	Molecular orbitals	53
3.7	The formation of multiple bonds	56
	Sigma and pi orbitals	56
	Valency: how many bonds can an atom form?	58
	Sharing one pair of electrons: the single bond	58
	Sharing two pairs of electrons: the double bond	59
	Sharing three pairs of electrons: the triple bond	60
	Satisfying valency with multiple bonds	60
	Hypervalency: going beyond the octet rule	62
3.8	Dative bonding: covalent bonding with a twist	64
	Dative bonds in biological systems	65
3.9	Aromatic compounds and conjugated bonds	66
3.10	Polyatomic compounds	69
3.11	Ionic versus covalent bonding	72
	Electronegativity: how easily can electrons be transferred?	72
	Ionic and covalent bonding in nature: which is most prevalent?	75
3.12	Blurring the boundaries: polarized bonds	75
	How strongly is a bond polarized?	77
	Non-polar covalent bonds	78
4	Molecular interactions: holding it all together	82
4.1	Chemical bonding versus non-covalent forces	82
	Intramolecular versus intermolecular forces	84
	The significance of molecular interactions	84

4.2	Electrostatic forces: the foundations of molecular interactions	85
	Polar bonds in non-polar molecules	89
4.3	The van der Waals interaction	90
	Dispersion forces	90
	Permanent dipolar interactions	94
	Steric repulsion	95
	Balancing attraction and repulsion: the van der Waals interaction	95
4.4	Beyond van der Waals: other biologically essential interactions	97
	Hydrogen bonds	97
	Ionic forces	103
	Hydrophobic forces	106
	Holding it together: non-covalent interactions in biological molecules	110
4.5	Breaking molecular interactions: the three states of matter	112
	Changing states	114
	The transition between states	115
	The impact of non-covalent interactions on melting and boiling points	116
<hr/>		
5	Organic compounds 1: the framework of life	120
5.1	Organic chemistry	120
	Carbon: its defining features	121
	The key components of organic compounds	122
5.2	The framework of organic compounds	124
	Representing chemical structures: the structural formula	125
	The alkanes: the backbone of organic chemistry	127
	The shape of organic compounds	130
	Physical properties of the alkanes	132
	Chemical properties of the alkanes	134
5.3	Functional groups within the carbon framework	135
	The double bond	136
	The alkenes: hydrocarbons with a double carbon–carbon bond	137
	The alkynes: hydrocarbons with a triple carbon–carbon bond	140
5.4	Adding functional groups to the carbon framework	140
	Alkyl groups	141
	The aryl group: a special hydrocarbon group	144
	Functional groups and the properties of organic compounds	145
	Effect 1: We see an increase in melting and boiling points	145
	Effect 2: We see an increased solubility in polar solvents, like water	146
	Functional groups versus the carbon framework: a balancing act	147
<hr/>		
6	Organic compounds 2: adding function to the framework of life	151
6.1	Organic compounds with oxygen-based functional groups	151
	The alcohols: the hydroxyl group	151
	The ethers: the alkoxy group	154

The aldehydes and ketones: the carbonyl group	157
The carboxylic acids: combining the hydroxyl and carbonyl groups	163
The esters: a modified carboxyl group	166
6.2 Organic compounds with nitrogen-based functional groups	170
The amines: the amino group	170
The amides: the amide group	176
6.3 Other functional groups	179
The thiols and the sulfur-based functional group	179
The haloalkanes and the halogen-based functional group	179
<hr/>	
7 Biological macromolecules: providing life's infrastructure	185
7.1 Amino acids and proteins	185
The composition of amino acids	185
Formation of polypeptides	187
7.2 Carbohydrates	191
The composition of monosaccharides	192
7.3 Lipids	195
Steroids	195
Triacylglycerols	197
Glycerophospholipids	200
7.4 Nucleic acids	203
Nucleotides and their composition	204
Formation of nucleic acids	206
The shape of nucleic acids	207
Nucleotides: nature's energy stores	208
7.5 Metals in biology	210
Metals and molecular structure: the zinc finger motif	211
Metals and biological function: metalloproteins	213
<hr/>	
8 Molecular shape and structure 1: from atoms to small molecules	218
8.1 The link between structure and function	218
8.2 The shape of small molecules	219
Bond lengths	219
8.3 Bond angles	223
Valence Shell Electron Pair Repulsion (VSEPR)	223
VSEPR theory and the shape of molecules with multiple bonds	227

8.4 Hybridization and shape	230
Hybridizing different numbers of orbitals	231
8.5 Bond rotation and conformation	238
Conformation versus configuration	240
Limitations on bond rotation	242
<hr/>	
9 Molecular shape and structure 2: the shape of large molecules	247
9.1 Constructing larger molecules	247
The geometry of joined atoms	248
The sequence of monomers within a polymer	248
Bonding between monomers	250
9.2 The shape of larger molecules	253
Primary structure	254
Secondary structure	254
Tertiary structure	261
Quaternary structure	263
The hierarchy of biological structure: a summary	266
9.3 Maintaining shape, and allowing flexibility	267
The importance of structural flexibility: muscle contraction	270
The importance of structural flexibility: enzymes	270
<hr/>	
10 Isomerism: generating chemical variety	278
10.1 Isomers	278
10.2 Structural isomers	279
Distinguishing structural isomers	280
Structural isomerism and the shape of the carbon framework	282
Structural isomerism and the positioning of functional groups	283
Structural isomerism: unifying chemical families	288
10.3 Stereoisomers	290
Geometric isomers	290
Enantiomers	298
10.4 Chirality	300
How do we distinguish one enantiomer from its mirror image?	304
Chirality in biological systems	308
10.5 The chemistry of isomers	311
The biological chemistry of enantiomers	313
The impact of chirality on medicinal chemistry	315

11 Chemical analysis 1: how do we know what is there?	319
11.1 What is chemical analysis?	319
11.2 How do we separate out what is there?	320
Solvent extraction	321
Chromatography	325
Electrophoresis	330
Centrifugation	335
11.3 Measuring mass: mass spectrometry	337
How does mass spectrometry work?	338
How does mass spectrometry separate chemical species on the basis of mass?	339
The mass spectrum: the outcome of mass spectrometry	341
Coupling separation to identification	346
11.4 Building up the picture: spectroscopic techniques	347
Spectroscopy and electromagnetic radiation	348
What are we measuring during spectroscopy?	350
Using spectroscopy to characterize chemical compounds	353
11.5 Characterizing the carbon framework: nuclear magnetic resonance spectroscopy	353
11.6 Identifying functional groups (1): infrared spectroscopy	360
11.7 Identifying functional groups (2): UV-visible spectroscopy	365
The UV-visible spectrum	366
11.8 Establishing 3D structure: X-ray crystallography	368
The crystal problem—keeping things real	369

12 Chemical analysis 2: how do we know how much is there?	373
12.1 The mole	373
Connecting molar quantities to mass	374
12.2 Concentrations	378
Calculating the number of moles of substance in a sample of solution	379
Preparing a solution of known concentration	380
Calculating the concentration of a solution	383
12.3 Changing the concentration: solutions and dilutions	384
The principles of diluting a solution	384
Serial dilutions	388
12.4 Measuring concentrations	392
UV-visible spectrophotometry	393
Atomic spectroscopy	397
Fluorescence spectroscopy	399

12.5 Using chemical reactions to measure concentration	400
Titrations	402
Electrochemical sensors	405
<hr/>	
13 Energy: what makes reactions go?	410
13.1 What is energy?	410
The conservation of energy	411
Kinetic energy	412
Potential energy	413
13.2 Energy transfer	419
The transfer of energy as work	421
The transfer of energy as heat	421
Heat versus temperature	423
13.3 Enthalpy	424
Energy transfer during chemical reactions	425
How can we determine the enthalpy change for a reaction?	428
Depicting enthalpy changes: the energy diagram	430
Enthalpy changes for different processes	433
Enthalpy changes and the stability of chemical compounds	434
13.4 Entropy: the distribution of energy as the engine of change	435
Entropy in chemical and biological systems	437
The link between entropy and energy	439
Spontaneous reactions and entropy	442
13.5 Spontaneous versus non-spontaneous processes: how much energy do we need?	445
13.6 Gibbs free energy: the driving force of chemical reactions	448
The Gibbs free energy of spontaneous reactions	451
Gibbs free energy and cell metabolism	454
<hr/>	
14 Kinetics: what affects the speed of a reaction?	459
14.1 The rate of reaction	459
What is the rate of a reaction?	461
The dependence of reaction rate on concentration	464
14.2 The collision theory of reaction rates	471
Increasing the concentration	472
Increasing the temperature	472
14.3 The activation energy: getting reactions started	474
Breaking the energy barrier: the transition state	475

14.4 Catalysis: lowering the activation energy	476
The role of catalysts in chemical reactions	477
14.5 Enzymes: the biological catalysts	480
The specificity of enzymes	481
What happens during enzyme catalysis?	483
14.6 Enzyme kinetics	486
Increasing substrate concentration: the limitation of the enzyme's active site	486
Determining the values of K_M and V_{max}	489
Increasing temperature: the limitation of being a protein	494
<hr/>	
15 Equilibria: how far do reactions go?	498
15.1 Equilibrium reactions	498
Equilibrium reactions and change	500
Does it matter which reaction is 'forward' and which is 'back'?	504
15.2 Forward and back reactions: where is the balance struck?	505
The equilibrium constant	507
The magnitude of equilibrium constants	509
15.3 The reaction quotient	513
Predicting the direction of a reaction	514
15.4 Binding reactions in biological systems	516
What does the dissociation constant tell us?	518
15.5 Perturbing an equilibrium	521
Changing the concentration of the system	522
Changing the pressure or volume of the system	526
Changing the temperature	528
Catalysts and chemical equilibria	529
15.6 Free energy and chemical equilibria	530
The van't Hoff isotherm and predicting spontaneity	532
The van't Hoff isotherm and the position of equilibrium	533
<hr/>	
16 Acids, bases, and the aqueous environment: the medium of life	538
16.1 Acids and bases: making life happen	538
Defining acids and bases	539
Acids and bases in aqueous solution	540
Pairing up acids and bases: the conjugate acid–base pair	541
16.2 The strength of acids and bases: to what extent does the dissociation reaction occur?	545
Juggling protons: the tug-of-war between conjugate acid–base pairs	547
The acid dissociation constant: to what extent does an acid dissociate?	548
The base dissociation constant: to what extent does a base dissociate?	549
pK_a and pK_b	551

16.3 Keeping things balanced: the ion product of water	555
Making use of the ion product of water	556
Linking K_w , K_a , and K_b	557
16.4 Measuring concentrations: the pH scale	559
The pH of strong and weak acids	560
Linking weak acid strength and pH: using the Henderson–Hasselbalch equation	562
pH and the ion product of water: balancing $[H^+]$ and $[OH^-]$	563
Changing pH: neutralization reactions	563
pOH: the basic equivalent of pH	565
16.5 The behaviour of acids and bases in biological systems	566
The effect of acidity and basicity on partitioning between aqueous and hydrophobic systems	567
The effect of pH on acidity and basicity	568
16.6 Buffer solutions: keeping pH the same	571
How does a buffer solution work?	571
The pH of buffer solutions	575
Preparing buffer solutions to a desired pH	578
<hr/>	
17 Chemical reactions 1: bringing molecules to life	583
17.1 What is a chemical reaction?	583
The stoichiometry of chemical reactions	584
17.2 The molecular basis of chemical reactions	586
How do valence electrons move during chemical reactions?	586
Depicting the movement of electrons	587
17.3 Heterolytic reactions	588
Heterolytic reactions and the polarization of bonds	591
17.4 Oxidation and reduction	594
Oxidation and reduction in biological systems	595
Oxidation and reduction during enzyme catalysis	596
17.5 Homolytic reactions	599
Homolytic versus heterolytic cleavage	600
Initiation	601
Propagation	602
Termination	605
Free radicals in biological systems	605
<hr/>	
18 Chemical reactions 2: reaction mechanisms driving the chemistry of life	609
18.1 An introduction to reaction mechanisms	609
Transition states and intermediates	610

18.2 Substitution	613
Nucleophilic substitution	613
Electrophilic substitution	616
18.3 Addition	620
Addition across a carbonyl double bond	622
18.4 Elimination	626
One-step versus two-step elimination	628
Elimination versus substitution	628
18.5 Condensation	631
Hydrolysis: reversing condensation	634
18.6 Biochemical reactions: from food to energy	639
The reaction mechanisms underpinning glycolysis	640
Beyond glycolysis: how the oxidation of glucose ultimately powers the cell	649

<i>Epilogue</i>	657
<i>Bibliography</i>	658
<i>Answers to self-check questions</i>	660
<i>Index</i>	665
