Contents

PART 1. INTRODUCTORY REMARKS AND DEFINITIONS

Chapter 1	Introduction	3
Chapter 2	A sample search model	5

PART 2. SEARCH PROBLEMS WITH ERROR-FREE TESTS

Chapter 3	Binary search problems without restrictions on the tests	11
	1. Introduction	11
	2. Nonsequential strategies and separating systems	12
	3. Random nonsequential strategies	13
	4. Sequential strategies and prefix codes	16
	5. Kraft's inequality and the noiseless-coding theorem	18
	6. Huffman's algorithm	22
	7. Optimal strategies with uniform distribution on the search domain	26
Chapter 4	Alphabetic codes and binary search trees	29
	1. Introduction	29
	2. Minimizing the search time in the worst case	31
	3. Good and optimal alphabetic codes	32
	4. Constructing optimal binary search trees	41
	5. The efficient construction of good binary search trees	47
	6. Lower bounds on the costs of optimal binary search trees	53
	7. Optimal binary search trees and optimal alphabetic codes with maximal costs	59
Chapter 5	Sorting problems	65
	1. Introduction	65
	2. Sorting a set with distinct elements	67
	3. Sorting a set of not necessarily distinct elements	71
	4. Sorting the disjoint union of two ordered sets	74
	5. The median problem	77
	6. The selection problem and the partition problem	89
	7. Yao's hypothesis	91
	8. The mass production of partial orders	94

Chapter 6	Weighting problems and geometric problems	99
	1. Introduction	99
	2. Finding a counterfeit coin with a beam balance	99
	3. Finding a counterfeit coin with an analytical balance	101
	4. Separating systems of sets with at most k elements	103
	5. Separating coins of various weights	106
Chapter 7	Special search problems with error-free tests	112
	1. Introduction	112
	2. A medical search problem	112
	3. The questionnaire theory	117
	4. The number of available strategies	119
PART 3. SEARCH PROBLEMS HAVING TESTS WITH CHANCE ERRORS		
Chapter 8	Stochastic approximation	125
	1. Introduction	125
	2. Approximate solution of equations by the Newton–Raphson rule	126
	3. The iteration method of v. Mises and Pollaczek-Geiringer	128
	4. The Robbins–Monro method of stochastic approximation	130
	5. Almost-everywhere convergence of the RM method	134
	6. Approximating the maximum of a regression function	138
	7. Dvoretzky's approximation method	140
	8. Estimations of the convergence rate of the RM method	146
	9. Sequential minimax search for the maximum of a unimodal function	150
Chapter 9	Search problems having answers with chance errors and channels with feedback	154
	1. Introduction	154
	2. An equivalent information-theoretic problem	158
	3. An error-free method	160
	4. Shannon's coding theorem	163
	5. Feedback does not increase the capacity of discrete memoryless channels	165
	6. A block-coding method: information as list reduction	168
	7. A robust model	174
	8. A Bayes method	176
	9. A common generalization of the noiseless-coding theorem and Shannon's coding theorem, sequential methods	177
	10. Gaussian channels with feedback and stochastic approximation	182
Chapter 10	Identification and ranking problems	187
	1. Introduction	187
	2. A model for general sequential multi-decision problems	191
	3. Upper bounds for the expected loss	192
	4. Conditions for the finiteness of the average sample number and its higher moments	195
	5. A lower bound on the average sample number for a multi-decision problem	198
	6. The ordering theorem	200
	7. Identification problems and their algebraic structure	204
	8. A fundamental sequential decision procedure	207
	9. Special identification problems	210
	10. Paulson's sequential procedure for selecting the population with the largest expected value from k normal distributed populations	213

PART 4. SEARCH PROBLEMS WITH INSPECTIONS

Chapter 11	Minimizing expected search costs	219
1.	Introduction	219
2.	The existence of successful strategies with finite expected search costs	223
3.	Methods for improving existing strategies	225
4.	The existence and the construction of optimal strategies	227
5.	The class of pseudostrategies	232
6.	Constructing almost-optimal strategies	235
Chapter 12	Maximizing the probability of success with limited resources	236
1.	Introduction	236
2.	The existence of optimal allocations	238
3.	Can there be fast algorithms for solving the problem?	238
4.	Bounds for the maximal probability of success and dividing the problem in subproblems	240
5.	An algorithm for constructing an optimal allocation	243
6.	The analysis of the algorithm	245
Chapter 13	More general models for search problems with inspections	248
1.	Introduction	248
2.	Almost periodic strategies	248
3.	Optimal strategies for locating the object being sought	250
4.	Discrete search domains with infinitely many elements	252
5.	Continuous search problems with inspections	252
6.	Searching for one of several objects	256
7.	Search problems with random parameters	259
8.	Search and stop problems	260
9.	Search problems with positive switch costs	264
10.	Searching for a nonstationary object	265
11.	Searching without being discovered	267
12.	Linear search	269
