

Peter Mohn

Magnetism in the Solid State

An Introduction

With 72 Figures and 7 Tables

Springer

Contents

1.	A Historical Introduction	1
2.	Consequences of Fermi Statistics	12
2.1	Quantum Statistics of Fermions	12
2.2	Free Energy of the Fermi Gas	15
3.	Paramagnetism	23
4.	Energy Bands in the Crystal	29
5.	Experimental Basis of Ferromagnetism	35
5.1	Nickel Alloys	40
5.2	Iron Alloys	41
5.3	Palladium Alloys	42
5.4	Iron–Nickel Alloys	42
5.5	Effects of Strong Magnetic Fields	42
5.6	Effects of High Pressure	44
5.7	Effects of Finite Temperature	45
5.8	Susceptibility above T_c	45
5.8.1	Susceptibility of “Classical Spins”	46
5.9	Critical Exponents	48
5.10	Neutron Diffraction	49
5.11	Further Experimental Methods	50
6.	Weiss Molecular Field Model	51
6.1	Rhodes–Wohlfarth Plot	57
7.	Heisenberg Model	59
7.1	Magnon Operators	59
7.2	Heisenberg Hamiltonian in Magnon Variables	62
7.3	Magnon Dispersion Relation	63
7.3.1	Specific Heat of Magnons	65
7.3.2	Ordering Temperature	66

7.4	Approximations for the Heisenberg Model	67
7.4.1	Ising Model	67
7.4.2	XY Model	68
7.4.3	Mean Field Solutions of the Heisenberg Model	69
8.	Itinerant Electrons at 0 K	71
8.1	Pauli Susceptibility of the Itinerant Electrons	76
8.2	Susceptibility of the Interacting Itinerant Electrons	76
8.3	Non-linear Effects	79
8.4	Effects of High Fields at 0 K	79
8.4.1	Non-magnetic Limit	80
8.4.2	Strong Ferromagnets	81
8.4.3	Weak Ferromagnets	81
8.4.4	bcc Iron and hcp Cobalt	81
8.4.5	Extremely High Fields	83
8.4.6	Metamagnetism	83
8.5	Susceptibility of Paramagnetic Alloys	85
9.	Band Gap Theory of Strong Ferromagnetism	88
9.1	Magnetism of Alloys	92
10.	Magnetism and the Crystal Structure –	
	Covalent Magnetism	96
10.1	Crystal Structure of Mn, Fe, Co, and Ni	98
10.2	Covalent Magnetism	100
10.3	Covalent Polarization	106
11.	Magnetic Impurities in an Electron Gas	111
11.1	Impurity Potential in the Jellium	111
11.2	Strong Perturbations in the Jellium	113
11.3	Layer and Line Defects	113
11.4	Magnetic Impurities and Oscillations of the Magnetization	114
12.	Itinerant Electrons at $T > 0$: A Historical Survey	116
12.1	Excitations at Low Temperatures	120
12.1.1	Strongly Ferromagnetic Systems	120
12.1.2	Weakly Ferromagnetic Systems	121
12.2	Stoner Theory for a Rectangular Band	123
12.3	Weak Excitations with $\zeta \ll 1$	125
13.	Hubbard Model	128
13.1	Beyond Hartree–Fock	130
14.	Landau Theory for the Stoner Model	132
14.1	General Considerations	132
14.2	Application to the Stoner Model	134

15. Coupling Between Itinerant and Localized Moments	139
16. Origin of the Molecular Field	142
16.1 Heitler–London Theory for the Exchange Field	142
16.1.1 Magnetism of a Spin Cluster	147
16.1.2 Spinwaves for Localized Electrons	149
17. Exchange and Correlation in Metals	152
17.1 Free Electron Gas	152
17.2 Tightly Bound Electrons	154
18. Spin Fluctuations	159
18.1 Fluctuations of a Thermodynamical Variable	160
18.2 Fluctuations of the Magnetic Moment	161
18.3 Specific Heat of the Spin Fluctuations	166
18.4 Magneto–Volume Coupling	167
18.5 Applications of the Spin Fluctuation Model	169
18.6 Comparing the Spin-Fluctuation and the Stoner-Model	171
19. Single Particle Excitations Versus Spin Waves	173
20. Landau–Ginzburg Model for Spin Fluctuations	178
21. Conclusion and Lookout	186
Appendices	189
A. Convexity Property of the Free Energy	189
B. Derivation of the Coefficient a in (3.17)	189
C. Quenching of the Orbital Momentum	192
D. Properties of “Classical” Spins	194
E. Derivation of the Constant c in (8.24)	196
F. Ornstein–Zernicke Extension	197
G. Bogoliubov–Peierls–Feynman Inequality	199
H. The Factor 2 in Equation (7.27)	200
I. Hund’s Rules	202
J. Polynomial Coefficients in (18.12)	204
K. Conversion Between Magnetic Units	205
References	207
Index	213
