# Contents

---

	Information and systems theory . . . . .	v
CHAPTER 1	<b>Setting up Equations for Sampled-Data Systems</b> . . . . .	1
	1.1 Methods; the problem of discontinuities . . . . .	1
	1.2 General method of difference equations . . . . .	5
	1.3 Linear sampler followed by a nonlinearity . . . . .	9
	1.4 Carson transform . . . . .	15
	1.5 Pulse-width modulation . . . . .	17
	1.6 System with different time constant for loading and unloading . . . . .	19
	1.7 Systems with position modulation . . . . .	20
	1.8 Systems with quantized cadence modulation . . . . .	22
	1.9 Systems with variable period; integral modulation . . . . .	24
CHAPTER 2	<b>Graphical Analysis of Nonlinear Discrete Systems</b> . . . . .	26
	2.1 Systems with constant sampling period. Matrix representation . . . . .	26
	2.2 Graphical analysis of second-order systems . . . . .	28
	2.3 Graphical methods based on scalar representation of difference equation . . . . .	37
	2.4 Discrete phase plane method . . . . .	41
CHAPTER 3	<b>Stability of Nonlinear Sampled-data Control Systems</b> . . . . .	46
	3.1 Cypkin's geometric criterion . . . . .	46
	3.2 The Węgrzyn-Vidal algebraic criterion . . . . .	56
	3.3 The Kalman-Bertram algebraic criterion . . . . .	62
	3.4 Application of the concept of distance in a metric space to determination of stability domains . . . . .	69

	3.5 Application of the distance concept to quantized sampled-data systems	72
	3.6 Stochastic dynamic behavior	81
<b>CHAPTER 4</b>	<b>Review Problems</b>	<b>95</b>
