Contents

Preface

1 The Causes of Movement 1

The Influence of the Spatial Separation of Phenomena 2

The Influence of Specialization, Agglomeration, and Scale Economies 2

The Influence of the Spatial Separation of Resource Endowments 6

Relative accessibility of resources Political considerations Economic space and corporate considerations

The Causes of Movement: A Conceptual Framework 9

Place and time utility Complementarity Intervening opportunities Transferability

2 Distance: Concepts, Measures, and Transformations 13

Concepts of Distance 13

Point-to-point distances Distance in a group of points

Measures of Distance 21

Physical measures Time measures Economic measures Perceptual measures

Map Transformations 25

Logarithmic transformations Topological transformations

3 Costs of Overcoming Distance 30

Transport Cost 31

Transport Price and Rate Structure 33

Pricing of goods movement Pricing of people movement Pricing of information movement

Transport Costs as a Factor of Production . 39
Relative importance of transport inputs *Locational implications of transport inputs*
Time, Transport Costs, and Location 49
Cost-space convergence *Time-space convergence*

4 Nodes and Routes 54

Nodes 55
Types and characteristics of nodes *The functions of nodes in a movement-related context* *The locational characteristics of nodes*
Routes 67
Route capacity and route location *The functions of routes* *The impact of routes*

5 Transportation Networks 78

What Are Models and Why Models? 78
Networks as Models 79
Graph-theoretic descriptions of networks *Network regionalization*
Alternative network configurations
Nodal and Route Hierarchies 102
Nodal hierarchies *Route hierarchies* *Correspondence of nodal and route hierarchies*

6 The Temporal Development and Prediction of Transportation Networks 110

Posing the Problem of Change 110
Stages-of-growth Models 114
Model of coastal penetration *Model of network development on a bounded isotropic surface*
Simulation Models 120
Simulation of alternative links *Simulation of circuits*
Chance and Network Development 128

7 Propensity for Interaction 133

Terra Cognita and Mental Maps 133
The world *Nations and regions* *The city*
Action Space and the Role of Distance 139
Individual and household action spaces *Socioeconomic differences in action spaces* *Cultural variations in action spaces*
Empirical Regularities in the Propensity for Interaction 144
Distance-decay functions *The mean information field*
The Concepts of Mass and Mass Propensity for Interaction 150

Behavioral Departures 152
Individual or Mass Propensity? 156

8 Nodal Characteristics as the Bases for Modeling Flows 158

Flows and Flow Maps 159
Flow Typologies 164
Deterministic and Stochastic Approaches 167
Deterministic approaches Stochastic approaches

9 Distance as the Basis for Modeling Flows 176

Flows as a Function of Nodal Mass and Distance: The Gravity Model 176
Development and derivation of the gravity model Examples of the application of gravity models Some operational problems Temporal and locational aspects of parameters of gravity models Critique and evaluation of the gravity model

Entropy-maximizing Model: A New Departure 197
The idea of a general system States of a system and alternative configurations Intrametropolitan journey to work in the context of entropy Introducing constraints on maximum entropy Evaluation of the entropy-maximization model

Entropy-maximizing Model: Technical Comments 206

10 The Structure of Flows 209

Rationale for Flow Structure 210
Flow Structures 213
Flows and "dominance order" of nodes Regionalization of flows

11 Spatial Diffusion Processes: Hierarchical and Contagious 226

Movement as Diffusion 227
Hierarchical Diffusion 228
Contagious Diffusion 234
The role of contact systems in diffusion The role of time in diffusion Modeling spatial diffusion

An Overview of the Spatial Diffusion Process 265

12 Efficiency of Routes and Flows 268

A Hierarchy of Problems in Economic Geography 268
Minimum-distance Paths 269
Minimal trees Shortest-path solutions
Link Addition 275
Flow Optimization 277
Capacitated networks The transportation problem

13 The Geographical Consequences of Circulation: A Systems Perspective	286
On Complex Systems	287
Growth Processes and the Role of Circulation	288
Spatial Interaction, Transport Innovation, and Spatial Reorganization	294
Postscript	297
Bibliography	299
Index	312
Credits	328
