CONTENTS

Introduction to the Series	v
Preface	vii

CHAPTER 1

Introduction to the theory of controlled semi-Markov processes – Basic concepts in preventive maintenance

1. Several typical examples of preventive maintenance	1
2. Terminology, criteria of optimality, and classification of preventive maintenance problems	8
2.1. Terminology	
2.2. Criteria of optimality	
2.3. Classification of preventive maintenance problems	
3. Definition and basic properties of the controlled semi-Markov process	14
3.1. Definition of the SMP	
3.2. Control actions and types of strategies	
3.3. Costs (returns)	
3.4. Finite-step process	
3.5. Finite-time process	
3.6. The process with an absorbing state	
3.7. Process on the infinite time interval	
4. Problems and exercises	48

CHAPTER 2

Preventive maintenance based on data of the lifetime distribution function

1. Operation of a single element for a fixed period of time	51
1.1. General description	
1.2. Statement of the problem	
1.3. Recurrence relations for returns	
1.4. Conclusion	

2. Operation of a single element for an infinite period of time	61
2.1. Statement of the problem	
2.2. Formula for operational readiness	
2.3. Investigation of the formula for operational readiness	
2.4. Concluding remarks	
3. Optimal group preventive maintenance	81
3.1. Statement of the problem	
3.2. Costs associated with ER, EPR and PR	
3.3. Formula for the expected cost per unit time	
3.4. Investigation of the formula for $u(t, T)$	
3.5. Numerical study of the group preventive maintenance	
3.6. Special cases of group preventive maintenance	
3.7. Additional comments on the model of group preventive maintenance	
4. Which preventive maintenance is better: Age or block replacement?	99
5. Optimal age replacement using only data on mathematical expectation and variance	103
6. Problems and exercises	109

CHAPTER 3

Preventive maintenance based on system parameter supervision

1. Introductory remarks	121
2. Optimal preventive maintenance for system with standby functioning on a finite time interval	125
2.1. Statement of the problem	
2.2. The observed process ξ_i , service strategy, and costs	
2.3. Recurrence relations for costs in the process ξ_i	
2.4. Example	
3. Determination of the inspection times for a partially repaired system	135
3.1. Statement of the problem	
3.2. Recurrence relations for the expected costs	
3.3. Computation of transition probabilities $P_{ij}(t)$ in the process $\eta(t)$	
3.4. Example for the computation of the optimal strategy	
3.5. Possible generalizations	
4. Optimal use of standby elements	147
4.1. Statement of the problem	
4.2. Recurrence relations for the probability of total failure	
4.3. Example	

4.4. Optimality of “zero-strategy”	
4.5. Possible generalizations	
5. Optimal replacement policy for a “multiline” system	156
5.1. Statement of the problem	
5.2. The relation for the expected return per unit time when every line has a constant failure rate	
6. Preventive maintenance using prognostic parameter	162
6.1. General description and definition of prognostic parameter	
6.2. Formula for operational readiness when preventive maintenance uses the prognostic parameter	
6.3. The case when the prognostic parameter is a Markov process with finite number of states	
6.4. Example	
6.5. The Poisson process as a prognostic parameter	
6.6. Linear random process $\eta(t) = bt$ as a prognostic parameter	
6.7. Effectiveness of preventive maintenance using prognostic parameter	
7. The problem of finding the optimal inspection period and optimal “depth” of preventive maintenance	177
7.1. Statement of the problem	
7.2. The observed process ξ_i and its properties	
7.3. Example	
7.4. Concluding remarks and possible generalizations	
8. Optimal control of a semi-Markov process in the presence of constraints on state probability	189
8.1. Statement of the problem	
8.2. Notation	
8.3. Finding the optimal strategy by means of LP – The problem without constraints	
8.4. The problem with a constraint	
8.5. Several constraints	
8.6. Duality in a problem without constraints	
9. Controlled Markov chain with randomly chosen set of control actions and control-limit strategies	201
9.1. An example and the formal model	
9.2. Optimal strategies in RCS-model when S_{i_0} contain only actions $E_i \rightarrow E_i$ and $E_i \rightarrow E_0$	
9.3. Control-limit strategies in the case of $Q = 1$	
10. Problems and exercises	210

CHAPTER 4

Special questions relevant to optimal preventive maintenance

1. Introduction	215
-----------------	-----

2. Optimal grouping of maintenance times for a hierarchically organized multicomponent system	216
2.1. General description	
2.2. Structure of the system and penalties	
2.3. Optimal periods for the system of the first order	
2.4. Optimal periods for the second-order system – Algorithm for the general case	
2.5. Concluding remarks	
3. Preventive maintenance of objects with multidimensional description of their state	229
3.1. General description	
3.2. The best scalarization	
3.3. How to organize preventive maintenance of an object with a multidimensional description of its state	
3.4. Preventive maintenance of hydraulic pumps using scalarization
