## 1 INTRODUCTION AND COMPOSITION OF PORTLAND CEMENT

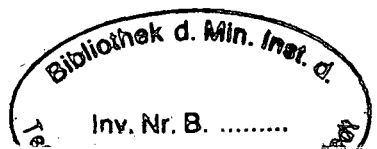

1.1	Introduction	1
1.1.1	Cementitious systems	1
1.1.2	Portland cement	2
1.1.3	Historical aspects	3
1.2	Composition of Portland cement	4
1.2.1	Nomenclature	4
1.2.2	High-temperature phase equilibria	5
1.2.3	Compound composition of Portland cement	7
1.3	Polymorphism and solid solution in clinker compounds	8
1.3.1	Tricalcium silicate	10
1.3.2	Dicalcium silicate	10
1.3.3	Tricalcium aluminate	11
1.3.4	Calcium aluminoferrite	12
1.4	Minor clinker compounds	13

## 2 RAW MATERIALS

2.1	Raw materials	15
2.1.1	Calcareous component	15
2.1.2	Argillaceous component	17
2.1.3	Additional or corrective components	19
2.1.4	Gypsum	19
2.1.5	Coal ash	20
2.2	Proportioning of raw materials	20
2.2.1	Calculation of the composition of a kiln feed	20
2.3	Reactivity of the raw materials	24
2.3.1	Model for combinability	26
2.4	Mechanical and physical properties of raw materials	28
2.4.1	Bond test – the Work Index	28
2.4.2	Ball mill grindability	29

## 3 PRODUCTION OF CEMENT CLINKER

3.1	Principal processes	31
3.2	Raw materials preparation	31
3.2.1	Wet process	32
3.2.2	Dry process	32
3.3	Pyroprocessing – physical and chemical processes involved	35
3.3.1	Wet process	35
3.3.2	Dry process	45
3.3.3	Semi-dry process (Lepol process)	46
3.3.4	Refractories	46
3.4	Thermal efficiency of pyroprocessing – the heat balance	47
3.4.1	Total energy consumption	48

## CONTENTS

### 4 CHARACTERISATION OF PORTLAND CEMENT CLINKER

4.1	Introduction – quality-control procedures	51
4.2	Chemical analysis by selective dissolution	51
4.2.1	Free lime	51
4.2.2	Other phases	52
4.3	Optical microscopy	52
4.3.1	Characteristics of the principal clinker phases	54
4.3.1.1	Alite	54
4.3.1.2	Belite	55
4.3.1.3	Other phases	55
4.3.2	Quantitative determination of phase composition	56
4.4	X-ray diffraction	56
4.4.1	Principles of quantitative X-ray diffraction analysis (QXDA)	58
4.4.2	Application of QXDA	59
4.5	Evaluation of quantitative methods of determining phase composition	60
4.6	Concluding remarks	62

### 5 GRINDING AND FINENESS OF CEMENT

5.1	Cement milling	63
5.1.1	Factors influencing the grindability of clinker	65
5.1.2	Addition of gypsum	66
5.2	Fineness of cement	67
5.2.1	Determination of surface area	67
5.2.2	Particle-size distribution	69

### 6 TESTS OF CEMENT QUALITY

6.1	Introduction	71
6.2	Setting times	71
6.3	Compressive strength	73
6.4	Workability	75
6.5	Soundness	77
6.6	Heat of hydration	78
6.7	Concluding remarks	81

### 7 THE HYDRATION OF PORTLAND CEMENT

7.1	Introduction	83
7.1.1	General introduction	83
7.1.2	Methods of investigating the kinetics of cement hydration	85
7.2	Hydration of the individual phases in Portland cement	85
7.2.1	Tricalcium silicate	85
7.2.1.1	Kinetics of tricalcium silicate hydration	91
7.2.1.2	Origin of the dormant period	94
7.2.2	Dicalcium silicate	95
7.2.3	Tricalcium aluminate	95
7.2.4	Calcium aluminoferrite	101
7.3	Hydration of Portland cement	102
7.3.1	High temperature and pressure hydration	104

### 8 THE NATURE OF HARDENED CEMENT PASTE

8.1	Introduction	105
8.2	Microstructure of hardened cement paste	105

## CONTENTS

8.3	Surface area and porosity of hardened cement paste	108
8.3.1	Surface area	108
8.3.2	Porosity	110
8.3.3	Pore size distribution	113
8.4	Physical properties of hardened cement paste	115
8.4.1	Permeability	115
8.4.2	Compressive strength	116
8.4.3	Elastic and inelastic properties	119
8.4.4	Drying shrinkage	124
8.5	Nature of the solid–solid bond in hardened cement paste	129
8.6	Concluding remarks	131
9 SPECIAL CEMENTS		
9.1	Special Portland cements	133
9.2	Pozzolanic cements	134
9.3	Slag cements	134
9.4	Expansive and shrinkage-compensated cements	135
9.5	Quick-setting cements	135
9.6	Oilwell cements	136
9.7	Admixtures	136
9.8	High alumina cement (HAC)	137
9.9	Concluding remarks	138
APPENDIX	Pore-size distribution from an adsorption isotherm	139
