

Constantino Tsallis

Introduction to Nonextensive Statistical Mechanics

Approaching a Complex World

 Springer

Contents

Part I Basics or How the Theory Works

1	Historical Background and Physical Motivations	3
1.1	Introduction	3
1.2	Background and Indications in the Literature	6
1.3	Symmetry, Energy, and Entropy	12
1.4	A Few Words on the Foundations of Statistical Mechanics	13
2	Learning with Boltzmann–Gibbs Statistical Mechanics	19
2.1	Boltzmann–Gibbs Entropy	19
2.1.1	Entropic Forms	19
2.1.2	Properties	21
2.2	Kullback–Leibler Relative Entropy	28
2.3	Constraints and Entropy Optimization	30
2.3.1	Imposing the Mean Value of the Variable	30
2.3.2	Imposing the Mean Value of the Squared Variable	31
2.3.3	Imposing the Mean Values of both the Variable and Its Square	32
2.3.4	Others	33
2.4	Boltzmann–Gibbs Statistical Mechanics and Thermodynamics	33
2.4.1	Isolated System – Microcanonical Ensemble	35
2.4.2	In the Presence of a Thermostat – Canonical Ensemble	35
2.4.3	Others	36
3	Generalizing What We Learnt: Nonextensive Statistical Mechanics	37
3.1	Playing with Differential Equations – A Metaphor	37
3.2	Nonadditive Entropy S_q	41
3.2.1	Definition	41
3.2.2	Properties	43

3.3	Correlations, Occupancy of Phase-Space, and Extensivity of S_q	54
3.3.1	A Remark on the Thermodynamical Limit	54
3.3.2	The q -Product	61
3.3.3	The q -Sum	64
3.3.4	Extensivity of S_q – Effective Number of States	66
3.3.5	Extensivity of S_q – Binary Systems	69
3.3.6	Extensivity of S_q – Physical Realizations	77
3.4	q -Generalization of the Kullback–Leibler Relative Entropy	84
3.5	Constraints and Entropy Optimization	88
3.5.1	Imposing the Mean Value of the Variable	88
3.5.2	Imposing the Mean Value of the Squared Variable	89
3.5.3	Others	90
3.6	Nonextensive Statistical Mechanics and Thermodynamics	90
3.7	About the Escort Distribution and the q -Expectation Values	98
3.8	About Universal Constants in Physics	102
3.9	Various Other Entropic Forms	105

Part II Foundations or Why the Theory Works

4	Stochastic Dynamical Foundations of Nonextensive Statistical Mechanics	109
4.1	Introduction	109
4.2	Normal Diffusion	110
4.3	Lévy Anomalous Diffusion	111
4.4	Correlated Anomalous Diffusion	111
4.4.1	Further Generalizing the Fokker–Planck Equation	117
4.5	Stable Solutions of Fokker–Planck-Like Equations	117
4.6	Probabilistic Models with Correlations – Numerical and Analytical Approaches	119
4.6.1	The MTG Model and Its Numerical Approach	120
4.6.2	The TMNT Model and Its Numerical Approach	125
4.6.3	Analytical Approach of the MTG and TMNT Models	129
4.6.4	The RST1 Model and Its Analytical Approach	132
4.6.5	The RST2 Model and Its Numerical Approach	133
4.7	Central Limit Theorems	135
4.8	Generalizing the Langevin Equation	144
4.9	Time-Dependent Ginzburg–Landau d -Dimensional $O(n)$ Ferromagnet with $n = d$	149
5	Deterministic Dynamical Foundations of Nonextensive Statistical Mechanics	151
5.1	Low-Dimensional Dissipative Maps	151
5.1.1	One-Dimensional Dissipative Maps	151
5.1.2	Two-Dimensional Dissipative Maps	164

- 5.2 Low-Dimensional Conservative Maps 165
 - 5.2.1 Strongly Chaotic Two-Dimensional Conservative Maps 166
 - 5.2.2 Strongly Chaotic Four-Dimensional Conservative Maps 172
 - 5.2.3 Weakly Chaotic Two-Dimensional Conservative Maps 173
- 5.3 High-Dimensional Conservative Maps 179
- 5.4 Many-Body Long-Range-Interacting Hamiltonian Systems 182
 - 5.4.1 Metastability, Nonergodicity, and Distribution of Velocities 186
 - 5.4.2 Lyapunov Spectrum 186
 - 5.4.3 Aging and Anomalous Diffusion 188
 - 5.4.4 Connection with Glassy Systems 190
- 5.5 The q -Triplet 191
- 5.6 Connection with Critical Phenomena 195
- 5.7 A Conjecture on the Time and Size Dependences of Entropy 196

- 6 Generalizing Nonextensive Statistical Mechanics 209**
 - 6.1 Crossover Statistics 209
 - 6.2 Further Generalizing 211
 - 6.2.1 Spectral Statistics 212
 - 6.2.2 Beck–Cohen Superstatistics 216

Part III Applications or What for the Theory Works

- 7 Thermodynamical and Nonthermodynamical Applications 221**
 - 7.1 Physics 222
 - 7.1.1 Cold Atoms in Optical Lattices 222
 - 7.1.2 High-Energy Physics 223
 - 7.1.3 Turbulence 227
 - 7.1.4 Fingering 233
 - 7.1.5 Granular Matter 233
 - 7.1.6 Condensed Matter Physics 235
 - 7.1.7 Plasma 237
 - 7.1.8 Astrophysics 241
 - 7.1.9 Geophysics 244
 - 7.1.10 Quantum Chaos 254
 - 7.1.11 Quantum Entanglement 255
 - 7.1.12 Random Matrices 255
 - 7.2 Chemistry 258
 - 7.2.1 Generalized Arrhenius Law and Anomalous Diffusion 258
 - 7.2.2 Lattice Lotka–Volterra Model for Chemical Reactions and Growth 259
 - 7.2.3 Re-Association in Folded Proteins 263

7.2.4	Ground State Energy of the Chemical Elements (Mendeleev's Table) and of Doped Fullerenes	265
7.3	Economics	266
7.4	Computer Sciences	269
7.4.1	Optimization Algorithms	269
7.4.2	Analysis of Time Series and Signals	275
7.4.3	Analysis of Images	279
7.4.4	PING Internet Experiment	280
7.5	Biosciences	281
7.6	Cellular Automata	282
7.7	Self-Organized Criticality	283
7.8	Scale-Free Networks	283
7.8.1	The Natal Model	290
7.8.2	Albert–Barabasi Model	291
7.8.3	Non-Growing Model	294
7.8.4	Lennard–Jones Cluster	295
7.9	Linguistics	295
7.10	Other Sciences	295
 Part IV Last (But Not Least)		
8	Final Comments and Perspectives	305
8.1	Falsifiable Predictions and Conjectures, and Their Verifications	305
8.2	Frequently Asked Questions	308
8.3	Open Questions	326
 Appendix A Useful Mathematical Formulae		
329		
 Appendix B Escort Distributions and q-Expectation Values		
335		
B.1	First Example	335
B.2	Second Example	339
B.3	Remarks	339
