Contents

Preface xi

Introduction 1

- 1.1. The notion of shell 1
- 1.2. Description of a shell and concept of thin shell 1
- 1.3. Purpose and scope of 'shell theory' 3

2 Differential geometry on and near the reference surface 5

- 2.1. Inner geometry of a surface 5
- 2.2. Outer geometry of a surface 14
- 2.3. Special lines on a surface 18
- 2.4. The ε -system in two dimensions 23
- 2.5. A summary of tensor analysis in three-dimensional Euclidean space 23
- 2.6. Differential geometry near the reference surface. Shell space 25
- 2.7. Integral transformation theorems 30

3 Kinematics of the shell 32

- 3.1. Positions of points 32
- 3.2. Base vectors in the shell space. Impenetrability condition 35
- 3.3. Components of the vectors \mathbf{d} and of their derivatives in the local trihedron $\{\mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_3\}^N$ 36
- 3.4. Strain measures 37
- 3.5. Simplifications in some formulae 38
- 3.6. Linearization of kinematics 41
- 3.7. Approximations for further simplification of kinematics 45
- 3.8. Alternative formulations 48
- 3.9. The compatibility conditions 48

4	The general balance equations	53
4.1.	Conservation of mass	53
4.2.	The equations of motion	55
4.3.	Conservation of energy	63
4.4.	Further comments on the quantities \mathbf{N}^{cc} , \mathbf{M}_N^{cc} , and \mathbf{m}_N	69
4.5.	The method of expanding stress components	73
5	Constitutive equations for elastic shells	78
5.1.	The constitutive law for three-dimensional hyperelastic bodies	78
5.2.	Some preliminary relations	80
5.3.	General constitutive equations for hyperelastic shells	81
5.4.	Linear constitutive equations	82
6	Variational theory	84
6.1.	Kinematic preliminaries	85
6.2.	Kinematic approximation	87
6.3.	Equations of motion and boundary conditions	88
7	Membrane theory	96
7.1.	The nature of the simplification	96
7.2.	Linear theory of the statics of elastic membranes	99
7.3.	The differential equations of deformation in the linear theory	100
7.4.	The flexion tensor	102
7.5.	Consequences of the analogy	104
7.6.	A theorem of work	107
7.7.	Explicit form of a linear constitutive equation	108
7.8.	Solving functions	111
7.9.	The membrane equations in physical components	114
7.10.	Membrane equations in Cartesian coordinates	115
7.11.	Affine membranes	118
7.12.	Differential equations of the Cauchy–Riemann type in the theory of membranes	119
7.13.	Generalized Cauchy–Riemann equations in the theory of membranes	124
7.14.	Digression on Wirtinger formalism	127
7.15.	Complex variables in the linear membrane theory	129
7.16.	Boundary conditions	132
7.17.	A non-linear theory of first order	134
7.18.	Bibliographical note	135

8 Bending theories 136

- 8.1. Reduced set of equations of motion obtained from the general balance equations 137
- 8.2. Linearized equations of motion 139
- 8.3. General remarks on constitutive equations of linear bending theories 140
- 8.4. Constitutive equations obtained by imposing additional conditions upon stress distribution only 140
- 8.5. Trefftz's method 148
- 8.6. The geometric Love–Kirchhoff hypothesis 152
- 8.7. Direct integration of stresses 153
- 8.8. Remarks on different systems of constitutive equations 154
- 8.9. Mixed tensor formulation of a linear shell theory 155
- 8.10. Boundary conditions and periodicity conditions. Edge effects 156
- 8.11. Non-linear bending theories 157
- 8.12. Shallow shells 158
- 8.13. Complex formulation in linear shallow shell theory 161
- 8.14. Bibliographical note 161

9 Direct theory 163

- 9.1. Polyhedra 164
- 9.2. Isometric surfaces 165
- 9.3. Uniqueness theorems 170
- 9.4. Converse statements 172
- 9.5. Continuous bending of surfaces 172
- 9.6. Infinitesimal bending 174
- 9.7. Associate surfaces 176
- 9.8. Rigidity theorems 178
- 9.9. Inferences from the rigidity and monotypy theorems 179
- 9.10. The rigid point Cosserat surface 180
- 9.11. The Cosserat surface 189
- 9.12. Constitutive equations in general 192

10 Existence of solutions of equilibrium problems 193

- 10.1. Classical solutions 194
- 10.2. Mathematical background 194
- 10.3. Existence of solutions of linear problems 195
- 10.4. Existence of solutions for shallow shells 197
- 10.5. Topological methods for investigating the existence of solutions 200

11 Stability 204

- 11.1. General remarks on stability 204
- 11.2. Branching theory and bifurcation 206

- 11.3. The energy test 210
- 11.4. Some simple particular problems of buckling 213
- 11.5. General bifurcation results for shallow shells 224
- 11.6. An asymptotic method for the determination of the upper critical load 233
- 11.7. The density of distribution of the bifurcation points of the linearized problem 238
- 11.8. Post-buckling behaviour 241
- 11.9. Initial-value approach to the load-deformation study of shells 243
- 11.10. Initial post-buckling analysis 244
- 11.11. Imperfection sensitivity 244
- 11.12. Non-stiff shells (null-load solutions) 245
- 11.13. Problems of dynamic stability 245

12 Error estimates 250

- 12.1. The sense of error estimates in shell theory 250
- 12.2. Methods using estimates in form of residuals 251
- 12.3. Pointwise bounds in boundary-value problems 253
- 12.4. Approximations by linear variational theories 263
- 12.5. Global estimates for the comparison of two shell theories with common spaces of admissible displacements 267
- 12.6. Methods of small parameters 270
- 12.7. The three-dimensional edge effect 272
- 12.8. Bounds for approximate solutions 273

13 Dynamics of shells 276

- 13.1. Linear differential equations 277
- 13.2. Free vibrations 280
- 13.3. Asymptotic study of free vibrations 281
- 13.4. The central set of equations 288
- 13.5. Frequency equation 289
- 13.6. Bending edge effect 290
- 13.7. Vibration zones 294
- 13.8. Nodal lines 295
- 13.9. Spectral theorems 296
- 13.10. The density of the eigenfrequencies 299
- 13.11. Spectrum of the membrane problem 299
- 13.12. Wave propagation 300
- 13.13. Caustics 303
- 13.14. The inverse problem 305
- 13.15. Loaded shells 307
- 13.16. Thickness effects 308
- 13.17. A set of shallow shell equations for non-linear problems of shell dynamics 308

- 13.18. A particular problem: small vibrations of a rotating cylindrical shell 310
- 13.19. Non-linear vibrations of complete cylindrical shells 313
- 13.20. Non-linear wave processes 318
- 13.21. A general perturbation method for non-linear free vibrations 318

14 Some statistical problems of shell theory 323

- 14.1. Definitions and facts from probability theory and mathematical statistics 324
- 14.2. Effects in linear theory 328
- 14.3. The problem of random perturbations 332
- 14.4. Probability distribution for critical loads 333
- 14.5. Probability of failure 333
- 14.6. The Fokker-Planck equation and its application to cylindrical panels 334
- 14.7. Pontriagin's equation 339
