Contents

1 Substantive Formulation of the Problem of Queueing Model Construction 1

1.1 Construction of a Model as an Object of Study 1

1.2 The Problem of Identification of Classes and Values of Model Parameters 6

1.3 The Problem of Model Simplification. Approximation of Models 9

1.4 The Stability Problem 10

1.5 A General Schema of Model Construction 12

1.6 Discussion and Review of Literature 14

2 The Concept of Characterization as a General Mathematical Schema for Constructing Queueing Models 17

2.1 Queueing Models. Formalization of Queueing Models 17

2.1.1 General Concepts and Notation 17

2.1.2 Single-Channel Models 21

2.1.3 Multichannel Models 26

2.1.4 The Multiphase Model 29

2.1.5 The Multiphase–Multichannel Model 29

2.2 The Problem of Pure Characterization of a Queueing Model 31

2.3 The Direct Characterization Problem and Its Stability 36

2.4 The Inverse Characterization Problem and Its Stability 42

2.5 Discussion and Review of the Literature 44

3 Probability Metrics 48

3.1 Introductory Remarks 48

3.1.1 The Concept of the Metric in Probability Theory 48

3.1.2 Problems of the Theory of Probability Metrics 52

3.2 The Concept of Probability Metric 53

3.2.1 Basic Notation and Definitions 53

3.2.2 Definition of Probability Metric. The Berkes–Philipp Lemma 55

3.2.3 Compound and Simple Metrics 57

3.3 Examples of Probability Metrics 57

3.3.1 Auxiliary Notation 58

3.3.2 Compound Metrics 60

3.3.3 Simple Metrics 62

3.4 Classification of Probability Metrics 70

3.4.1 The Hausdorff Structure (the h-Structure) 70

3.4.2 The Λ-Structure 73

3.4.3 Representation of the Hausdorff Structure in the Form of the Λ–Structure 74

3.4.4 The ζ-Structure of Probability Metrics 75

3.4.5 The ζ-Structure of Simple Metrics 76

3.5 The Concept of Minimality of Probability Metrics 77

3.5.1 Definition of Minimal Metric 77

3.5.2 Invariant Relations 79

3.6 Dual Relations for Compound and Related Minimal Metrics 84

3.6.1 Generalized Kantorovich Theorem 84

3.6.2 Strassen Theorem 87

3.7 Explicit Representations for Minimal Metrics 87

3.7.1 Minimal Metrics with the ζ-Structure 87

3.7.2 Minimal Metrics with the Hausdorff Structure 91

3.8 The Concept of Ideality of Probability Metrics 94

3.8.1 Definition and Basic Properties of Ideal Metrics 94

3.8.2 Ideal Metrics with the ζ-Structure 97

3.9 Topological Properties of Probability Metrics. The Concept of Compactness 100

3.9.1 Definitions. General Criterion of Topological Comparability of Metrics 100

3.9.2 The General Compactness Criterion 102
3.9.3 The Compactness Criterion for Weak Metrics 102
3.9.4 The Compactness Criterion for Strong Metrics 105
3.10 Relations Between Metrics 108
3.10.1 Bounds of the Metrics $\mu_{n,p}^{(7)}$ 108
3.10.2 Relations Between Minimal Metrics 112
3.10.3 Bounds for ζ-Metrics 114
3.10.4 Relations Between Ideal Metrics 119
3.11 Discussion of Results and Review of Literature 120

4 Characterization of the Components of Queueing Models 125
4.1 Formulation of the Problem 125
4.2 Characterization of a Poisson Flow in Terms of the Aging Property. Evaluation of Stability 128
4.2.1 Ag-Classes of Random Variables 128
4.2.2 Characterization of an Exponential Distribution in Terms of the Aging Property 131
4.2.3 Estimates of the Degree of Closeness of a Perturbed Flow to a Poisson Flow 136
4.3 Characterization of an Erlang Flow in Terms of the Aging Property 142
4.4 Characterization of a Renewal Flow in Terms of the Aging Property 145
4.4.1 The Order Relation Based on the Aging Property 146
4.4.2 Estimate of the Closeness of Flows Based on Weak Comparability of Their Components 149
4.5 Characterization of a Poisson Flow in Terms of the Lack-of-Memory Property 150
4.5.1 The LM-Property of Multivariate Distributions 150
4.5.2 Characterization of an Exponential Distribution in Terms of the LM-Property 156
4.5.3 Estimates of the Stability of Characterization of a Poisson Input Flow in Terms of the LM-Property 168
4.6 Stability of the Characterization of a Poisson Flow as a Stationary, Ordinary Flow Without Memory 172
4.6.1 Notation and Auxiliary Estimates 173
4.6.2 Stability of Characterization 179

4.7 Characterization of an Erlang Flow in Terms of the LM-Property 181
4.8 Characterization of Random Flows in Terms of Sample Characteristics 183
4.9 Auxiliary Results from a Comparison of Metrics 188
4.10 Discussion of Results and Review of Literature 200

5 Methods of Analysis of the Continuity of Queueing Models 202
5.1 Formulation of the Problem and Its Practical Import 202
5.2 Continuity on Finite Time Intervals (Output Data as a Random Sequence) 214
5.2.1 Basic Notation 214
5.2.2 General Evaluations of Continuity 217
5.3 Evaluations for Sequences Generated by Piecewise-Linear Transforms 225
5.3.1 Definitions 225
5.3.2 Properties of Piecewise-Linear Transforms 228
5.4 Examples 232
5.4.1 Duplication with Renewal 232
5.4.2 The Single-Channel Queueing Model 238
5.4.3 The Multichannel Queueing Model 239
5.4.4 The Multiphase Queueing Model 241
5.4.5 The Multiphase–Multichannel Queueing Model 241
5.5 Continuity on Finite Time Intervals (Output Data as a Stochastic Process) 242
5.6 Continuity Uniform in Time 251
5.6.1 Coupling of Random Sequences 251
5.6.2 Evaluations of Continuity in Terms of Coupling 252
5.6.3 Regenerative Processes 255
5.6.4 Renewal Processes 261
5.6.5 Estimates of the First-Passage Time 269
5.7 Examples 271
5.7.1 The Single-Channel Queueing Model 271
5.7.2 The Multichannel Queueing Model 281
5.7.3 The Multiphase–Multichannel Queueing Model 292
5.7.4 The Doubling-with-Renewal Model 295
5.8 Discussion of Results and Review of Literature 296

6 Construction of Queueing Models from Observations of Their Inputs – Direct Problems of Characterization 302

6.1 Introductory Remarks 302

6.2 Characterization of Queueing Models in Terms of the Aging Property. Evaluations of Stability 304

6.2.1 Characterization of a Model of the Type $MI_\lambda \mid MI_\mu \mid 1 \mid \infty$ 304

6.2.2 Characterization of Models with Erlang Input and Service Flows 310

6.2.3 Characterization of a Model of the Type GI | GI | 1 | ∞ 312

6.3 Characterization of Queueing Models in Terms of the Lack-of-Memory Property 313

6.3.1 Characterization of Models of the Type $MI_\lambda \mid MI_\mu \mid 1 \mid \infty$ and MI | MI | 1 | ∞ 313

6.3.2 Characterization of Models of the Type GI | GI | 1 | ∞ 318

6.4 Characterization of Queueing Models in Terms of Empirical Distributions of the Input Flow and Service Flow 319

6.5 Evaluations Uniform in Time of the Stability of Characterization 322

6.6 Characterization of the Multiphase–Multichannel Model 325

6.7 Unsolved Problems 326

7 Identification of Individual Queueing Models from Observations of Output Data – Inverse Characterization Problems 328

7.1 Introductory Remarks 328

7.2 Identification of Queueing Models 331

7.2.1 The Model MI | GI | 1 | ∞ 332

7.2.2 The Model G | G | 1 | ∞ 334

7.2.3 The Model M | GI | 1 | ∞ 339

7.2.4 The Model $MI_\lambda \mid GI_i \mid 1 \mid \infty$ 340

7.2.5 The Model $MI_\lambda \mid GI \mid 1 \mid 0$ 342

7.2.6 The Model GI | GI | ∞ 343

7.3 Identification of a Class of Queueing Models 344

7.3.1 The Model G | G | 1 | ∞ 344

7.3.2 The Model GI | GI | ∞ 345

7.4 Remarks and Comments 347

8 Simplification and Approximation of Probability Models 348

8.1 Formulation of the Problem, and an Approach to the Solution 348

8.2 Hyper-Erlang Approximation of Distribution Functions and Estimates of Its Accuracy 352

8.2.1 Formulation of the Problem 352

8.2.2 Erlang Approximation of a Degenerate Distribution 353

8.2.3 Hyper-Erlang Approximation of Arbitrary Distributions 358

8.3 Finite Approximation of Countable Markov Chains 361

8.3.1 Approximation of Stationary Distributions 361

8.3.2 Uniform Approximation of Prestationary Distributions 365

8.4 Finite Approximation of Noncountable Markov Chains 370

8.5 Approximation of Output Flows 379

8.6 The Problem of Asymptotic Consolidation of States 388

8.7 Discussion and Review of Literature 395

Appendix 1

The Prokhorov Criterion and Skorokhod's Theorem of the Weak Convergence of Measures 398

Appendix 2

The Duality Theorem of Linear Programming 400

Appendix 3

Uniformly Integrable Random Variables 401

Appendix 4

The Space $D[0, \infty)$ 403

Appendix 5

Ancillary Information from the Theory of Markov Processes 405

Appendix 6

Estimates of the Coupling Times for Discrete Renewal Processes 412
